- From Research to Implementation
- Ongoing research
- Summary

Background & definitions

- Read-across describes one of the data gap filling techniques used within analogue and category approaches
- “Analogue approach” refers to grouping based on a very limited number of chemicals (e.g. target substance + source substance)
- “Category approach” is used when grouping is based on a more extensive range of analogues (e.g. 3 or more members)

ABSTRACT

Read-across is a popular data gap filling technique used within analogue and category approaches for regulatory purposes. In recent years there have been many efforts focused on the challenges involved in read-across development, its scientific justification and documentation. Tools have also been developed to facilitate read-across development and application. Here, we describe a number of publicly available read-across tools in the context of the category/analogue workflow and review their respective capabilities, strengths and weaknesses. No single tool addresses all aspects of the workflow. We highlight how the different tools complement each other and some of the opportunities for their further development to address the continued evolution of read-across.

Availability	Free	Free	Free	Free	Free	Free

Sources of Uncertainty

- Analogue or category approach? (# analogues)
- Completeness of the data matrix – no. of data gaps
- Data quality for the underlying analogues for the target and source analogues
- Consistency of data across the data matrix – concordance of effects and potency across analogues
- Address the dissimilarities and whether these are significant from a toxicological standpoint
- Toxicokinetics
-

Uncertainty assessment

- There are several frameworks which aim to identify, document and address the uncertainties associated with read-across inferences/predictions
 - Blackburn & Stuard (2014)
 - Patlewicz et al (2015)
 - Schultz et al (2015)
 - ECHA RAAF (2015)
- However read-across acceptance relies on a subjective expert assessment
- There is no objective measure of read-across performance and acceptance

Quantifying Uncertainty & Assessing Performance of Read-Across

- **GenRA (Generalised Read-Across)** is a “local validity” approach
- Predicting toxicity as a similarity-weighted activity of nearest neighbours based on chemistry and/or bioactivity descriptors
- Generalised version of Chemical-Biological Read-Across (CBRA) developed by Low et al (2013)
- Goal: to systematically evaluate read-across performance and uncertainty using available data

$$y_i^{\beta, \alpha} = \frac{\sum_j^k s_{ij}^{\alpha} x_j^{\beta}}{\sum_j^k s_{ij}^{\alpha}}$$

Jaccard similarity:

$$s_{ij} = \frac{\sum_l (x_{il} \wedge x_{jl})}{\sum_l (x_{il} \vee x_{jl})}$$

$\alpha \in \{chm, bio, bc\}$

$\beta \in \{bio, tox\}$

$y_i = \text{predicted activity of chemical } (c_i)$

$x_j^{\beta} = \text{activity of } c_j \text{ in } \beta$

$s_{ij}^{\alpha} = \text{Jaccard similarity between } x_i^{\alpha}, x_j^{\alpha}$

$k = \text{up to } k \text{ nearest neighbours}$

GenRA - Approach

I. Data

1,778 Chemicals
3,239 Structure descriptors (chm)
820 Bioactivity hitcall (bio) ToxCast

574 toxicity effects (tox) ToxRefDB

II. Define Local neighbourhoods

Use K-means analysis to group chemicals by similarity
Use cluster stability analysis
~ 100 local neighbourhoods

III. GenRA

Use GenRA to predict toxicity effects in local neighbourhoods
Evaluate impact of structural and/or bioactivity descriptors on prediction
Quantify uncertainty

GenRA - Insights and Next Steps

- The approach enabled a performance baseline for read-across predictions of toxicity effects within specific study outcomes to be established but was still context dependent on the endpoint and the chemical
- Ongoing analysis:
- Consideration of other information to refine the analogue selection - e.g. **physicochemical similarity**, TK similarity, metabolic similarity, reactivity similarity...

Q

Wikipedia

Diethylene glycol (DEG) is an organic compound with the formula (HOCH2CH2)2O. It is a colorless, practically odorless, poisonous, and hygroscopic liquid with a sweetish taste. It is miscible in water, alcohol, ether, acetone, and ethylene glycol. DEG is a widely used solvent. It can be a contaminant in consumer products; this has resulted in numerous epidemics of poisoning since the early 20th century.... [Read more](#)

Similarity context

The screenshot displays the EPA GenRA interface. The top navigation bar includes tabs for GenRA (Beta), Chemical Properties, Synonyms, External Links, Env. Fate/Transport, Toxicity Values (Beta), Bioassays, Exposure, Literature, Similar Molecules (Beta), and Comments. The main content area is divided into three panels. The left panel shows a chemical structure diagram with 2-Methoxyethanol at the center, connected to various related compounds like Triethylene glycol, 2-Butoxyethanol, Ethylene glycol, 1,2-Propylene glycol, N,N-Diethylethanolamine, 2-Methyl-1-propanol, 2-Chloroethanol, Dimethylaminoethanol, Isopentyl alcohol, and 2-(Hexyloxy)ethanol. The middle panel contains a table of similarity scores (tox_txf, chm_mrgn, bio_txf, bio_txf2) for the listed compounds. The right panel shows a heatmap of toxicity data (DEV:Body Weight, DEV:Bone, SUB:Clinical Signs, SUB:Kidney, SUB:Liver, SUB:Mortality, DEV:Mortality, DEV:Uterus, DEV:Kidney, DEV:Food Consumption, DEV:Clinical Signs) for the same compounds. The bottom of the interface has a 'Run' button, a 'GenRA' dropdown, and filters for 'Min+: 0' and 'Min-: 0', along with a 'Filter by:' text input and 'Sim wt' and 'Export' buttons.

Ongoing research

Physchem Similarity Context

- Important context of similarity in read-across
- Models “bioavailability”
- Properties selected: Lipinski Rule of 5 (LogP, MW, # HB donors/acceptors)
- Two approaches investigated as a means to identify source analogs and evaluate their predictive performance relative to GenRA:

Approach 1: “Filter”

Subcategorise from a set of analogues identified based on structural similarity

Common approach

Approach 2: “Search Expansion”

“Frontload” both structure and physchem into analogue identification

Novel approach

Approaches considered

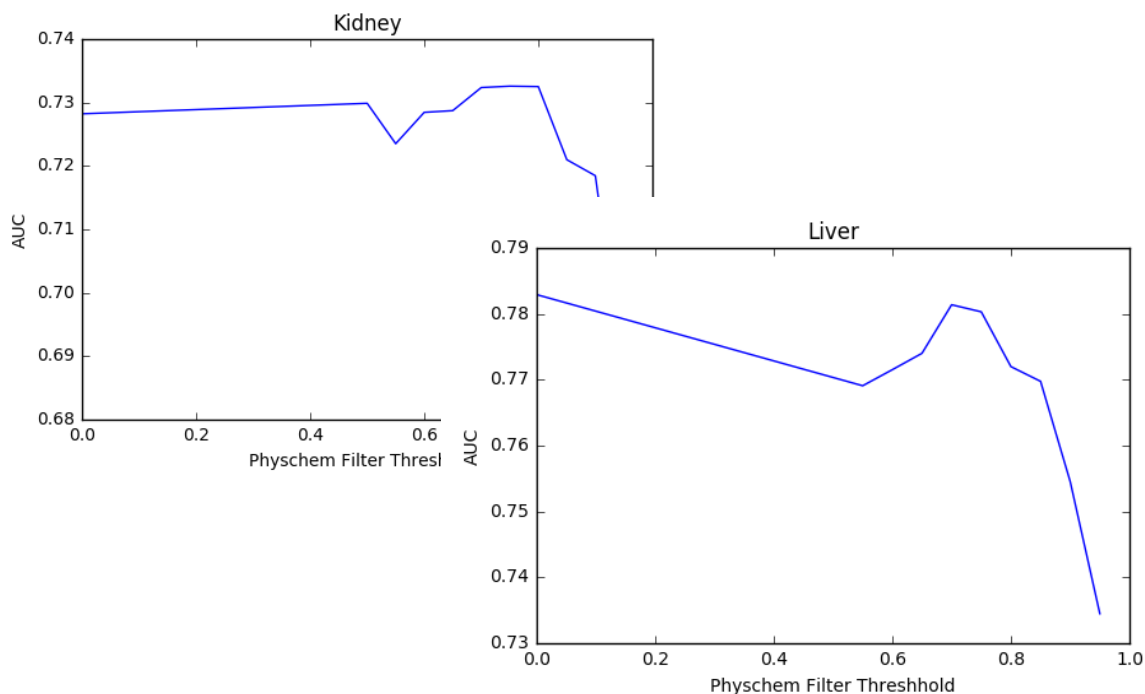

Approach 1: Filter

- Similarity search using Jaccard distance of Morgan chemical fingerprints to find source analogues. (Default of 10 nearest neighbours (k=10))
- Calculate physchem similarity between target and source analogues using a generalised Jaccard similarity metric
- Reduce neighbourhood based on the physchem similarity threshold

Approaches considered

Approach 1: Filter

- This approach did not perform as well as GenRA for the entire dataset, nor did it significantly improve any target organ predictions.

Approach 2: Search Expansion

- This approach shows a small improvement over baseline for entire dataset, but large improvement in certain organs.
- Target organ predictions that were significantly improved: Intestine Large, Intestine Small, Mammary Gland, Pancreas, Ureter, Urinary Bladder

Case Study: Butyl Benzyl Phthalate

GenRA: Baseline

Endpoint	Baseline Prediction
Body Weight	.78
Clinical Chemistry	.27
Food Consumption	0
Hematology	0
Kidney	.27
Liver	1
Mortality	.27
Pancreas	.27
Prostate	0
Skin	.27
Spleen	0
Tissue NOS	0
Urinary Bladder	0

- Chronic studies
- All true positive effects
- Predictions between 0 and 1
- Higher prediction indicates more and stronger positive neighbours

Case Study: Butyl Benzyl Phthalate

Approach 1: Filter

Filter out chemicals with
physchem similarity < 0.8

Endpoint

Body Weight
Clinical Chemistry
Food Consumption
Hematology
Kidney
Liver
Mortality
Pancreas
Prostate
Skin
Spleen
Tissue NOS
Urinary Bladder

- Filtering overturns incorrect predictions for 4 endpoints.
- BUT if filtering is too stringent, significant analogues are excluded resulting in a worse performance c.f original GenRA baseline

Case Study: Butyl Benzyl Phthalate

Approach 2: Search Expansion

New
Analogues identified
to add to the overall
neighbourhood

Endpoint	Baseline Prediction	Structure + Pchem Prediction
Body Weight	.78	.79
Clinical Chemistry	.27	.60
Food Consumption		
Hematology		
Kidney		
Liver		
Mortality		
Pancreas		
Prostate		
Skin		
Spleen		
Tissue NOS		
Urinary Bladder	0	0

- Adding phys-chem to similarity search overturns incorrect predictions for 2 endpoints
- Improves many others

Summary

- Many challenges still remain in read-across
- Quantifying the uncertainty of read-across prediction is a critical issue
- Work in NCCT is focused on systematic and objective approaches to read-across development, evaluation and application
- Established a “baseline” GenRA approach and highlighted progress to implement this approach into a practical tool
- Illustrated the impact on performance that physicochemical similarity can have on analogue identification & evaluation as part of ongoing research
