Definitions: Read-across

- Read-across describes the method of filling a data gap whereby a chemical with existing data values is used to make a prediction for a 'similar' chemical.
- A target chemical is a chemical which has a data gap that needs to be filled i.e. the subject of the read-across.
- A source analogue is a chemical that has been identified as an appropriate chemical for use in a read-across based on similarity to the target chemical and existence of relevant data.

ABSTRACT

Read-across is a popular data gap filling technique used within analogue and category approaches for regulatory purposes. In recent years there have been many efforts focused on the challenges involved in read-across development, its scientific justification and documentation. Tools have also been developed to facilitate read-across development and application. Here, we describe a number of publicly available read-across tools in the context of the category/analogue workflow and review their respective capabilities, strengths and weaknesses. No single tool addresses all aspects of the workflow. We highlight how the different tools complement each other and some of the opportunities for their further development to address the continued evolution of read-across.

Wikipedia

Fluconazole is an antifungal medication used for a number of fungal infections. This includes candidiasis, blastomycosis, coccidioidomycosis, cryptococcosis, histoplasmosis, dermatophytosis, and pityriasis versicolor. It is also used to prevent candidiasis in those who are at high risk such as following organ transplantation, low birth weight babies, and those with low blood neutrophil counts. It is given either by mouth or by injection into a vein.

Common side effects include vomiting

Short Communication

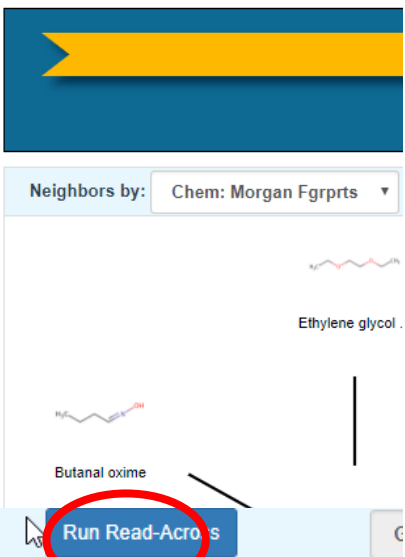

Generalized Read-Across (GenRA): A workflow implemented into the EPA CompTox Chemicals Dashboard

George Helman^{1,2}, Imran Shah², Antony J. Williams², Jeff Edwards², Jeremy Dunne² and Grace Patlewicz^{2*}

Abstract

Generalized Read-Across (GenRA) is a data driven approach which makes read-across predictions on the basis of a similarity weighted activity of source analogues (nearest neighbors). GenRA has been described in more detail in the literature (Shah et al., 2016; Helman et al., 2018). Here we present its implementation within the EPA's CompTox Chemicals Dashboard to provide public access to a GenRA module structured as a read-across workflow. GenRA assists researchers in identifying source analogues, evaluating their validity and making predictions of *in vivo* toxicity effects for a target substance. Predictions are presented as binary outcomes reflecting presence or absence of toxicity together with quantitative measures of uncertainty. The approach allows users to identify analogues in different ways, quickly assess the availability of relevant *in vivo* data for those analogues and visualize these in a data matrix to evaluate the consistency and concordance of the available experimental data for those analogues before making a GenRA prediction. Predictions can be exported into a tab-separated value (TSV) or Excel file for additional review and analysis (e.g., doses of analogues associated with production of toxic effects). GenRA offers a new capability of making reproducible read-across predictions in an easy-to-use-interface.

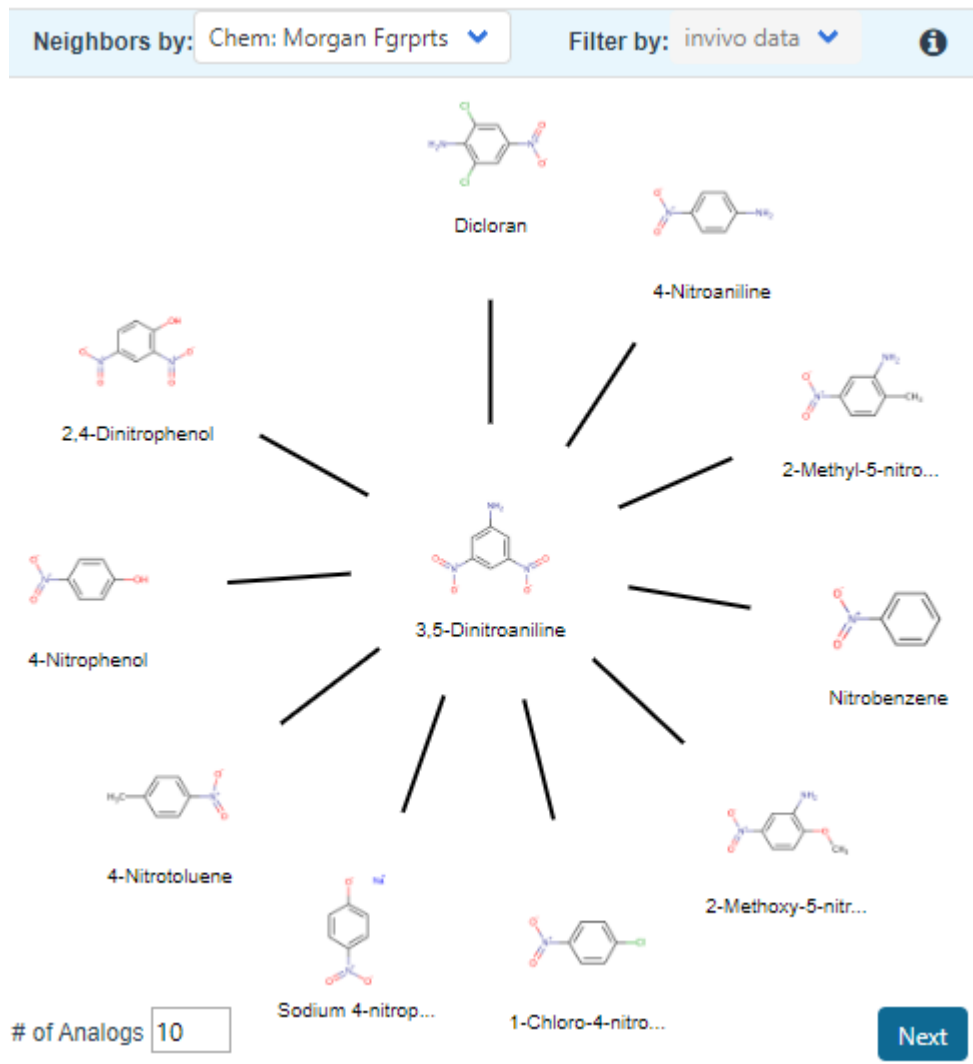

Run GenRA

GenRA in practice - step by step

Target chemical	Proposed source analogue	Primary similarity rationale
Structural		
3,5-Dinitroaniline 	4-Nitroaniline 	<p>Considerations for chemical class, structural moiety, reactivity, metabolism and toxicity were used to refine the pool of analogues. Selection of the source analogue is based on availability of toxicity values, duration of the principal study and health protectiveness of the adopted POD, given the commonalities in the toxicokinetic and toxicity profile for all the candidates.</p>

Considerations

Rank predictions based on the p-val and AUC values (where we have more confidence in the predictions)

Rank based on the target organ effects observed for the source analogues

GenRA - Ongoing research

- Summarising and aggregating the toxicity effect predictions to guide end users - what are the effects to be concerned about and which effect predictions are we most confident about
- Consideration of other information to define and refine the analogue selection - e.g. physicochemical similarity, metabolic similarity, reactivity similarity...
 - EPA New Chemical Categories
 - Quantifying the impact of physicochemical similarity on read-across performance (paper published)
 - Quantifying the impact of reactivity similarity on read-across performance (manuscript in late stages of development)

GenRA - Ongoing research

- Dose response information to refine scope of prediction beyond binary outcomes
 - Transitioning from qualitative to quantitative predictions - how to apply and interpret GenRA in screening level hazard assessment
 - Starting with quantitative data - e.g. acute rat oral toxicity, ToxRefDB v2 (2 manuscripts in review)

GenRA & Physchem Similarity Context

- Important context of similarity in read-across
- Models “bioavailability”
- Properties selected: Lipinski Rule of 5 (LogP, MW, # HB donors/acceptors)
- Two approaches investigated as a means to identify source analogs and evaluate their predictive performance relative to GenRA:

Approach 1: “Filter”

Subcategorise from a set of analogues identified based on structural similarity

‘Common’ approach

Approach 2: “Search Expansion”

“Frontload” both structure and physchem into analogue identification

‘Novel’ approach

Helman et al., 2018

Case Study: Butyl Benzyl Phthalate

Approach 2: Search Expansion

New Analogues identified to add to the overall neighbourhood

Endpoint	Baseline Prediction	Structure + Pchem Prediction
Body Weight	.78	.79
Clinical Chemistry	.27	.60
Food Consumption		
Hematology		
Kidney		
Liver		
Mortality		
Pancreas		
Prostate		
Skin	.21	.21
Spleen	0	.20
Tissue NOS	0	0
Urinary Bladder	0	0

- Adding phys-chem to similarity search overturns incorrect predictions for 2 endpoints
- Improves many others

Extending the Generalised Read-Across approach (GenRA): A systematic analysis of the impact of physicochemical property information on read-across performance

George Helman ^{a, b}, Imran Shah ^b, Grace Patlewicz ^b  

 [Show more](#)

<https://doi.org/10.1016/j.comtox.2018.07.001>

[Get rights and content](#)

Highlights

- GenRA approach is summarised in the context of the category workflow.
- The impact of physicochemical information on read-across performance was assessed in 2 ways: filtering and search expansion.
- Search expansion resulted in an up to 9% improvement in read-across performance for 10 of the 50 data rich target organs.
- Results are summarised on a neighbourhood (chemical category) basis.
- A case study substance is used to compare and contrast the read-across performance using the 2 approaches.

Refinements to the GenRA approach

- Transitioning GenRA from binary predictions to quantitative predictions
- Investigated extending GenRA using the acute oral rat systemic toxicity data collected as part of the ICCVAM Acute toxicity workgroup
- NICEATM-NCCT effort to collate a large dataset of acute oral toxicity to evaluate the performance of existing predictive models and investigate the feasibility of developing new models

Refinements to the GenRA approach: Acute toxicity

Database Resource	Rows of Data (number of LD50 values)	Unique CAS
ECHA (ChemProp)	5533	2136
JRC AcutoxBase	637	138
NLM HSDB	4082	2238
OECD (eChemPortal)	10206	2314
PAI (NICEATM)	364	293
TEST (NLM ChemIDplus)	13689	13545

Rat oral LD50s:
16,297 chemicals total
34,508 LD50 values

Require unique LD50 values
with mg/kg units

15,688 chemicals total
21,200 LD50 values

Preprocessing for modelling

11,992 chemicals
16,209 LD50 values

Karmaus et al, 2018; Kleinstreuer et al., 2018

Refinements to the GenRA approach: Acute toxicity

- Search for a maximum of 10 nearest neighbours on entire dataset
- Use a min similarity threshold of 0.5

- $R^2 = 0.61$
- RMSE = 0.58
- A few outliers, but not too extreme
- Residuals clustered around zero with no obvious patterns

Refinements to the GenRA approach: Acute toxicity

- 75-25 train-test splits
- R² values range from 0.52 to 0.69
- GenRA performs strongly and robustly on this acute tox data set.

Helman et al., in review

Take home messages

- Harmonised framework for read-across provides opportunities for NAM data
- GenRA developed is aligned with this framework
- Illustrated how GenRA baseline can be applied in practice
- Highlight ongoing research in extending the approach
 - quantitative impact of physicochemical similarity (as it relates to bioavailability)
 - transitioning to quantitative predictions of PODs
