

# Addressing Challenges in Cross-Species Extrapolation of Chemical Toxicity Information: Application of the SeqAPASS Tool

## Lead Instructor:

**Carlie A. LaLone, Ph.D.**

**Great Lakes Toxicology and Ecology Division  
Office of Research and Development  
U.S Environmental Protection Agency**

## Instructors:

**Donovan Blatz**

**Sara Vliet, PhD**

**Oak Ridge Institute for Science and Education**

**ORISE**

## Training format:

- |  |         |
|--|---------|
| • Overview presentation (LaLone)                           | Video 1 |
| • How to request a user account to SeqAPASS (Blatz)        | Video 2 |
| • Demonstration of SeqAPASS functionality (LaLone & Blatz) | Video 3 |
| • Case Examples (Vliet)                                    | Video 4 |

## Goals for training:

- Introductory training for new/beginner SeqAPASS user
- Understand why SeqAPASS was developed
- Gain a basic understanding of how SeqAPASS evaluations work
- Understand the general workflow of SeqAPASS
- Independently submit a SeqAPASS query
- Independently collect output from SeqAPASS
- Develop box-plot visualizations

## Available Knowledge

## Science-based, Streamlined, Transparent, Publicly Accessible PIPELINE

## Predict Susceptibility

# Chemical Safety Evaluation

- Protect human health and the environment
  - Ensure that chemicals in the marketplace are reviewed for safety
- Challenging mission:
  - Tens of thousand of chemicals are currently in use and hundreds are introduced annually
  - Many have not been thoroughly evaluated for potential risk to human health and the environment
    - *Chemicals tested across species: Even more sparse*

# Reduce Animal Testing at the US EPA

- EPA Administrator Andrew Wheeler signed directive (Sept. 10<sup>th</sup> 2019) to reduce animal testing
  - Calls for the Agency to:
    - Reduce its request for, and funding of, mammal studies by 30% by 2025
      - That is ~5 years from today!
    - Eliminate all mammal study requests and funding by 2035
      - That is ~15 years from today

**How do we get there?**  
**NAMs**

# Transformation of Toxicity Testing

## Historically:

### Whole animal test

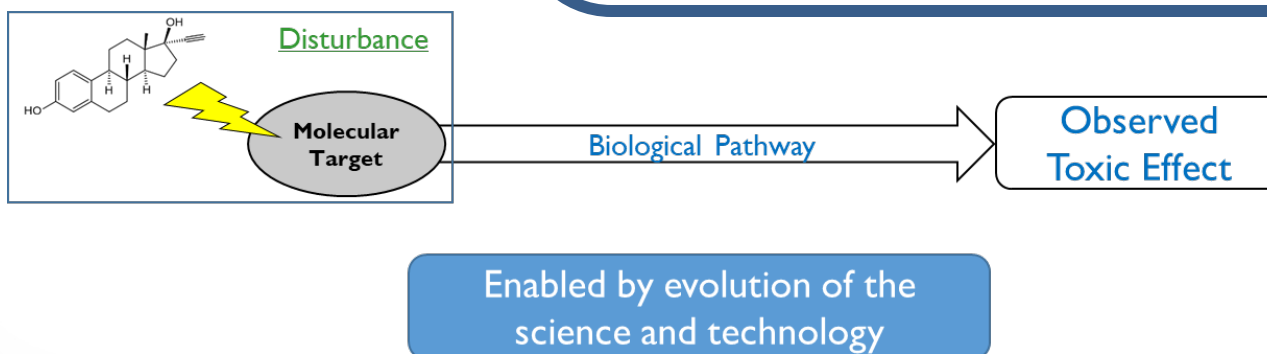

- Observe Toxic Outcome
    - Examples
      - tumor development
      - mortality
- Resource intensive

## Toxicity Testing in the 21<sup>st</sup> Century:

- *In vitro* and *in silico* methods
  - Pathway-based approaches
  - Focus on disturbance of the biological pathway
    - Predictive of the observable toxic effects

- Informatics
- High throughput
- Systems biology
- OMICs

## New Approach Methods (NAMs)

# Model Organisms for Toxicity Testing

- Assumed that sensitivity of species to a chemical is a function of their relatedness

- Human Health Risk Assessment

Cannot Test

|||

Use of Surrogates

- Ecological Risk Assessment

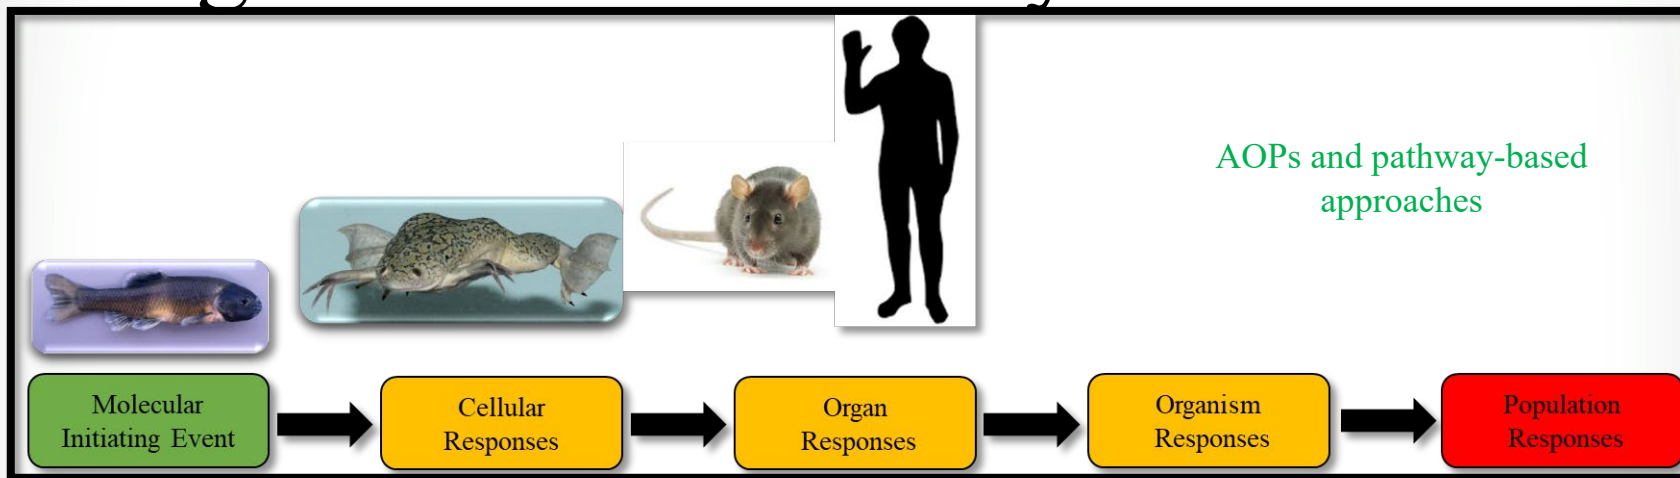

Cannot Test

|||

Representative species across a diversity of organism classes

# Surrogates in 21<sup>st</sup> Century Chemical Safety

## AI and Text Mining of Available Toxicity Literature

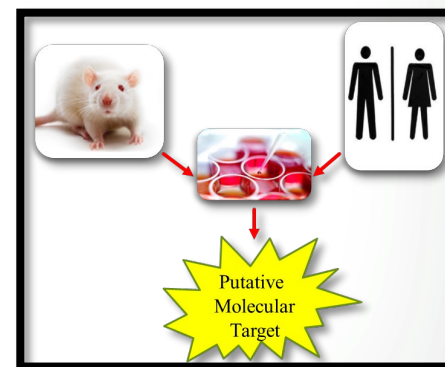

Is the model organism  
A good surrogate for the  
Species we are trying to protect?

Maybe

Could we gather evidence rapidly  
to help us understand this question?

Absolutely!!!

## HTS

# Considering chemical sensitivity?

## Factors that make a species sensitive

- Exposure
- Dose
- ADME
- **Target receptor availability**
- Life stage
- Life history
- etc.
- etc.

## Simple question to address:

Is the known chemical target available in a species for a chemical to act upon?

Yes or No

Likely susceptible or Not likely susceptible (at least through the known mechanism)

# New Approach Methods: Species Extrapolation

## New tools and technologies have emerged

- Improved sequencing technologies
- Large databases of sequence data

As of this week

~161 million Proteins

~98 thousand Species

- **Focus on the molecular machine: The Protein**

- Large biomolecule assembled from amino acids encoded in genes

Primary Structure: Chain of amino acid residues

- Many functions (e.g., catalyze reactions, structural/mechanical functions, cell signaling, immune response, etc.)

- **Evaluate protein similarity between species**

- Moving away from empirical testing and qualitative understanding of molecular target (protein) conservation to quantitative measures

<https://seqapass.epa.gov/seqapass/>

# Sequence Alignment to Predict Across Species Susceptibility (SeqAPASS)

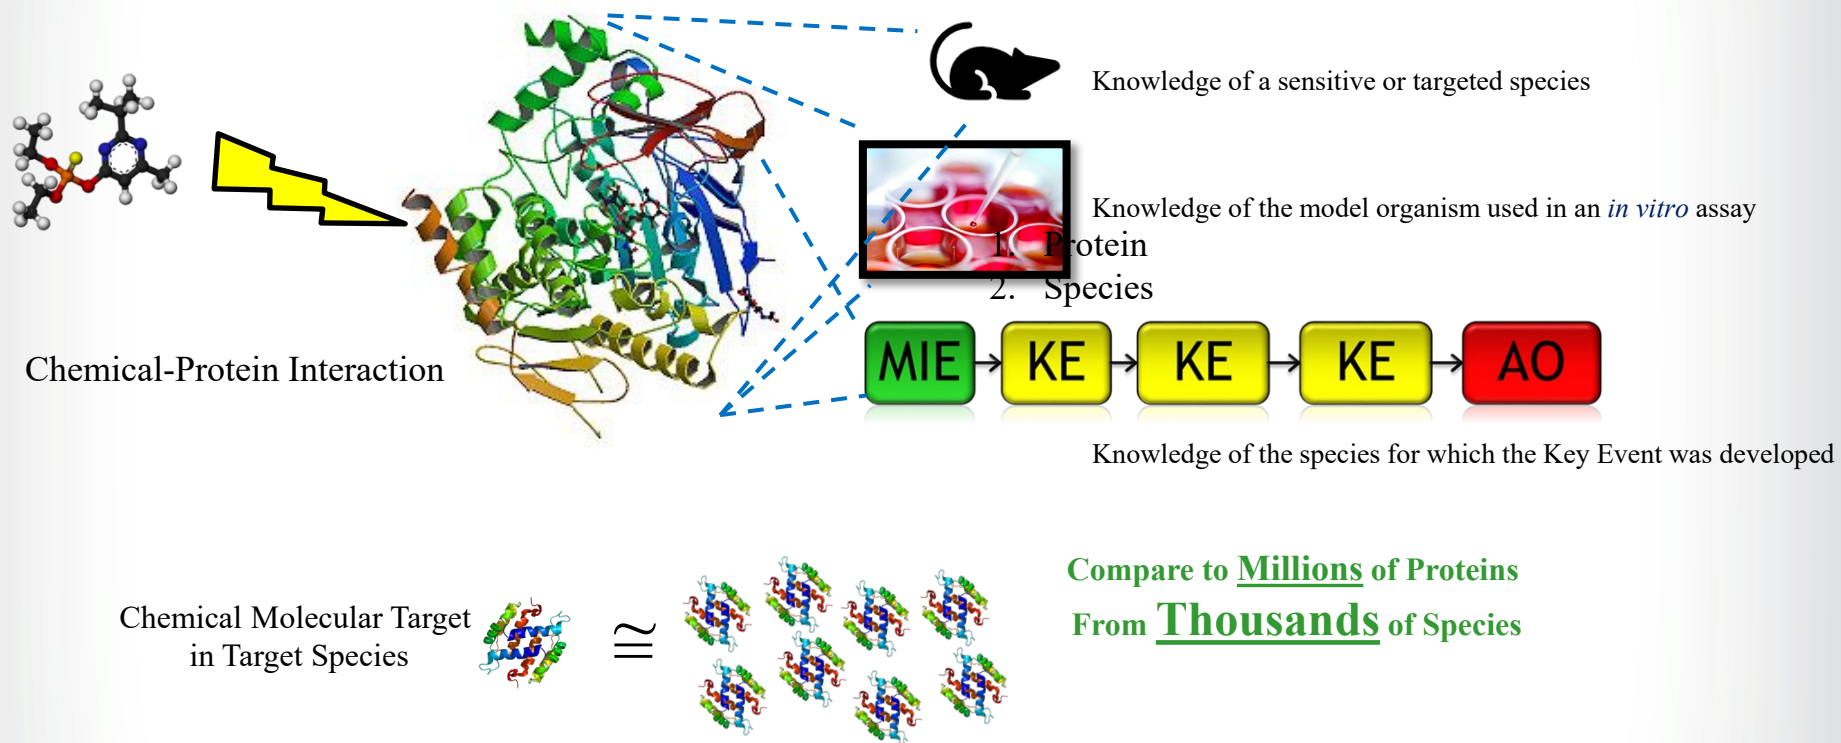

## Sequence Alignment to Predict Across Species Susceptibility (SeqAPASS): A Web-Based Tool for Addressing the Challenges of Cross-Species Extrapolation of Chemical Toxicity

Carlie A. LaLone,<sup>\*,1</sup> Daniel L. Villeneuve,<sup>\*</sup> David Lyons,<sup>†</sup> Henry W. Helgen,<sup>‡</sup>  
Serina L. Robinson,<sup>§,2</sup> Joseph A. Swintek,<sup>¶</sup> Travis W. Saari,<sup>\*</sup> and  
Gerald T. Ankley<sup>\*</sup>

# What information is required for a SeqAPASS query?

Greater similarity = Greater likelihood that chemical can act on the protein  
Line of Evidence: Predict Potential Chemical Susceptibility Across Species

Yes	Yes	Yes

**Gather Lines of Evidence for Conservation of Protein Target:  
Susceptibility Prediction: Yes or No**

# SeqAPASS evaluation

- **Needed information: Query Sequence**

1. The chemical's molecular (protein) target:

- **Pharmaceuticals**

- » <https://www.drugbank.ca/>
- » <http://sitem.herts.ac.uk/aeru/vsdb/index.htm>
- » [http://bidd.nus.edu.sg/group/cjttd/TTD\\_HOME.asp](http://bidd.nus.edu.sg/group/cjttd/TTD_HOME.asp)

- **Pesticides and other chemicals**

- » <http://lilab.ecust.edu.cn/ptid/index.html>
- » <http://www.t3db.ca/>

- **AOP initiators**

- » <https://aopwiki.org/>

- **EPA tested chemicals**

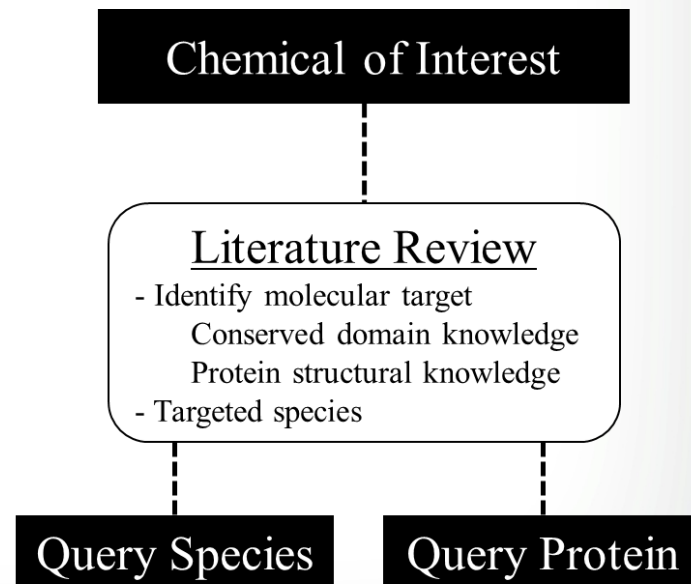

- » <https://comptox.epa.gov/dashboard>

- **Literature review**

2. The target species or sensitive species

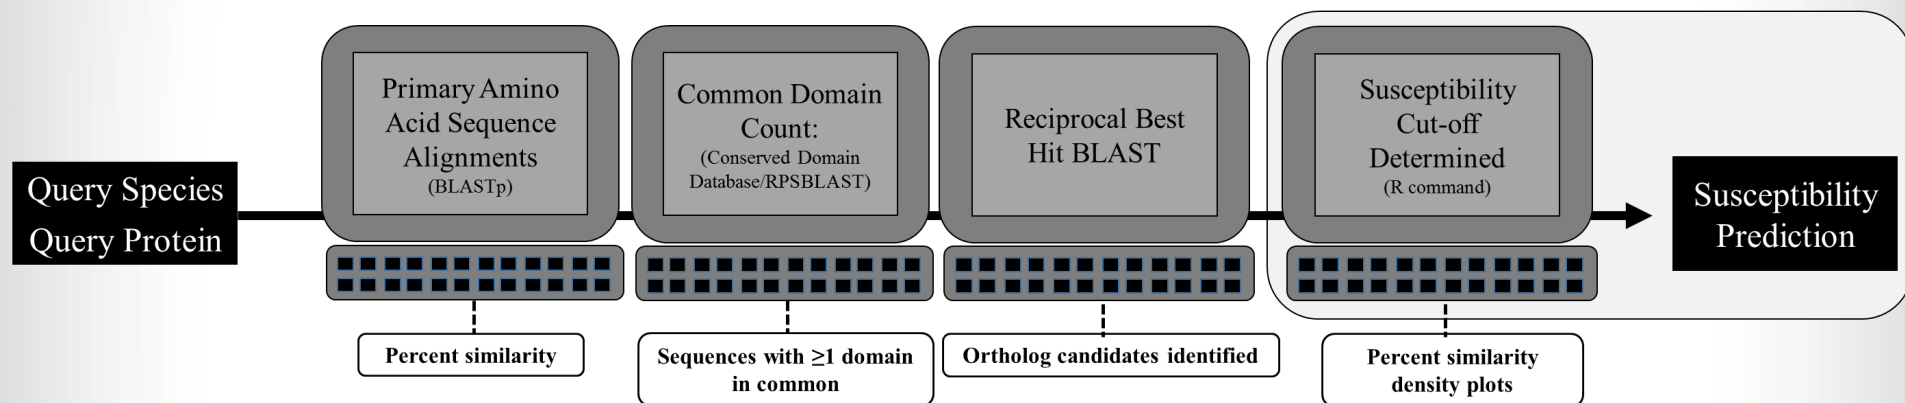

- **Case Study:**

- <https://cfpub.epa.gov/ecotox/>
- **Literature review**

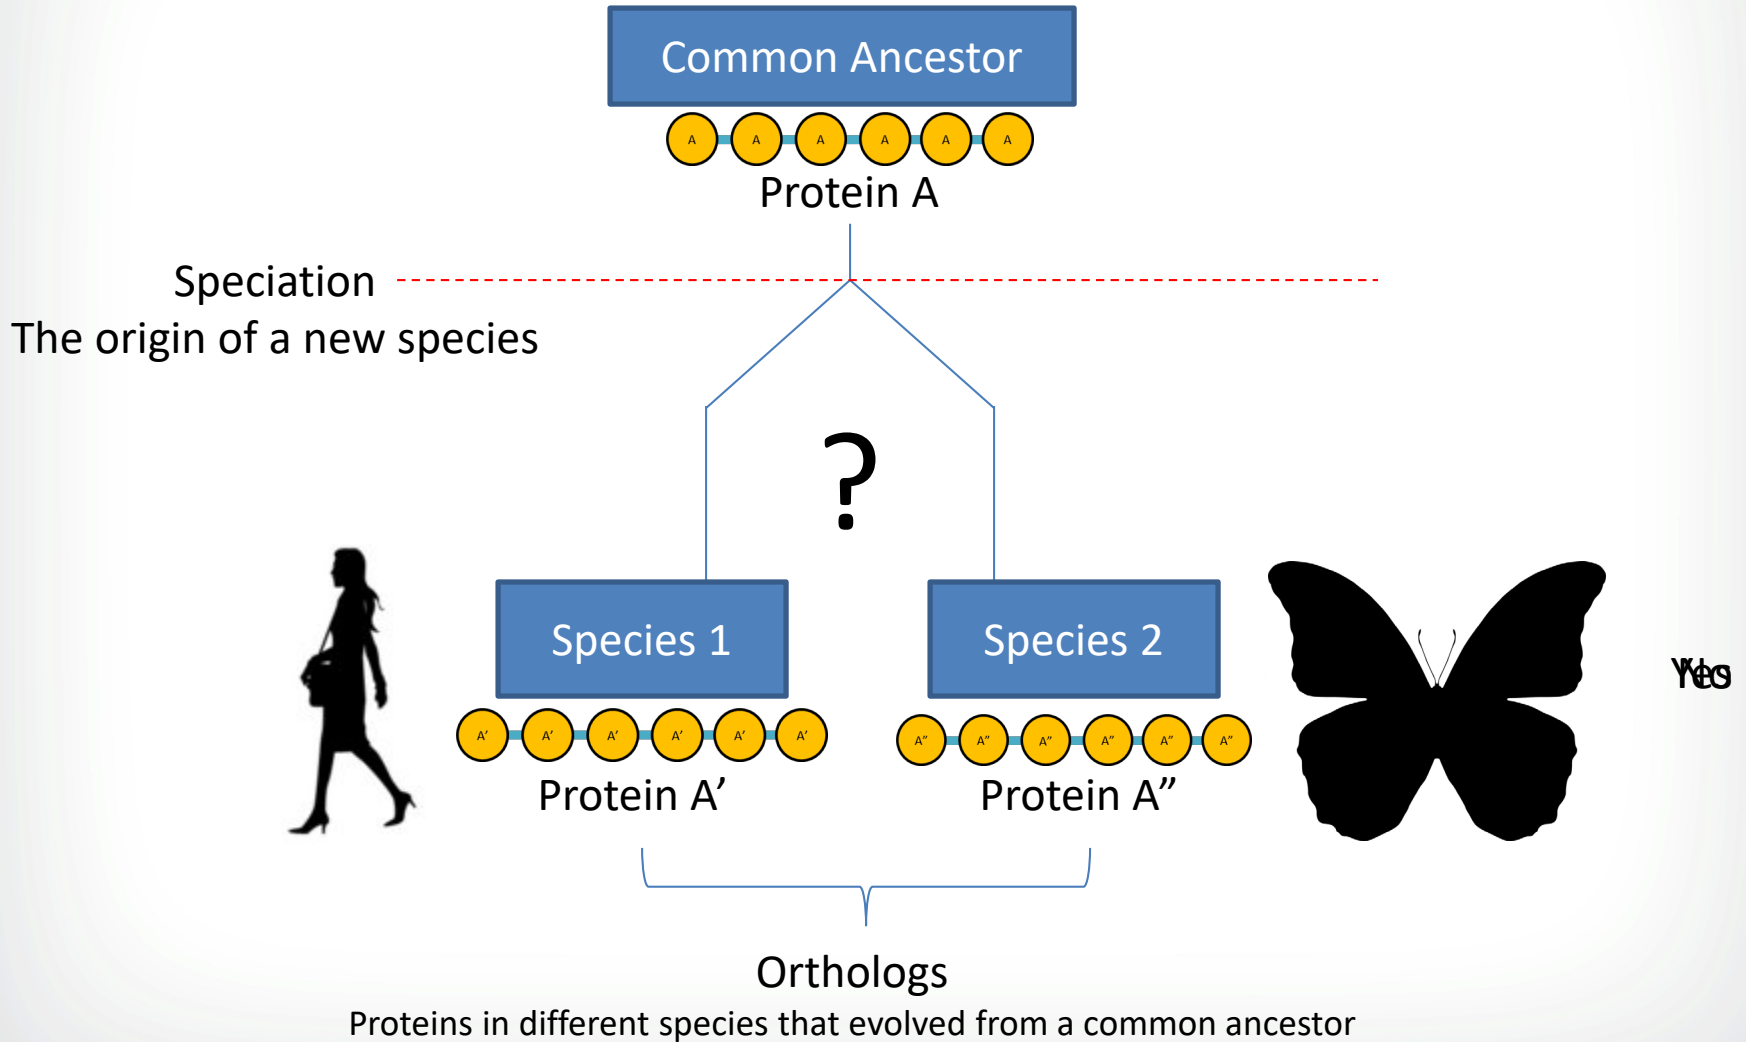

## Level I: Primary Amino Acid Sequence Comparisons

	Align Full Primary Amino Acid Sequence	Bit Score	Percent Similarity
Query Sequence		1241.9	100
Hit		1229.5	99.0
Hit		1223.0	98.5
Hit		1111.3	89.5
Hit		862.4	69.4

$$\text{Percent Similarity} = \frac{\text{Hit Bit Score}}{\text{Query Bit Score}} \times 100$$

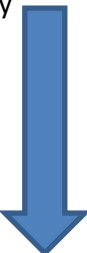

Normally, orthologs retain the same **FUNCTION** in the course of evolution

## Ortholog Candidates and Predicting Susceptibility with SeqAPASS

- **Ortholog = likely to maintain similar FUNCTION**

Common Name	Ortholog Candidate	Cut-off	Percent Similarity
Human	Y	33.15	100
Florida manatee	Y	33.15	98.8
Mallard	Y	33.15	82.29
Rock pigeon	Y	33.15	80.93
Green anole	Y	33.15	80.65
Pacific transparent sea squirt	Y	33.15	33.15
Yesso scallop	N	33.15	32.87
Purple sea urchin	N	33.15	26.05
Human whipworm	N	33.15	23.53
Bed bug	N	33.15	21.62

 Lowest % Similarity that is still an ortholog

### Example:

Susceptibility Cut-off: Set at 33.15

Above cut-off: More likely to be susceptible base on similar FUNCTION

## Level 2: Functional domain comparisons

Query Sequence	Primary Amino Acid Sequence	Bit Score	Percent Similarity
Query Sequence domain		482.6	100
Hit domain		471.9	97.8
Hit domain		303.5	62.9
Hit domain		100.1	20.7

$$\text{Percent Similarity} = \frac{\text{Hit Bit Score}}{\text{Query Bit Score}} \times 100$$

# SeqAPASS output

The CompTox Chemistry Dashboard  
<https://comptox.epa.gov/dashboard>

# Box-Plot of SeqAPASS Data

## Level 3: Individual Amino Acid Residue Comparison

Crystal structure of protein – Ligand bound

Amino acid residues that interact with the chemical

Where can I find this information?

- Literature Review
  - Types of studies I'd be looking for:
    - Site-directed mutagenesis
    - Field resistance (pesticides)
    - Studies of x-ray crystallography
    - Homology modeling

This is not trivial....it can take some time to identify literature and formulate the Level 3 query

## Level 3: Individual Amino Acid Residue Comparison

SeqAPASS can **AUTOMATICALLY** predict whether an amino acid difference is likely to change protein-chemical interaction.

Amino Acid	1-Letter	Side Chain Class	Molecular Weight (g/mol)
Aspartic Acid	D	Acidic	133.104
Glutamic Acid	E	Acidic	147.131
Alanine	A	Aliphatic	89.094
Glycine	G	Aliphatic	75.067
Isoleucine	I	Aliphatic	131.175
Leucine	L	Aliphatic	131.175
Proline	P	Aliphatic	115.132
Valine	V	Aliphatic	117.148
Asparagine	N	Amidic	132.119
Glutamine	Q	Amidic	146.146
Phenylalanine	F	Aromatic	165.192
Tryptophan	W	Aromatic	204.228
Tyrosine	Y	Aromatic	181.191
Histidine	H	Basic	155.156
Lysine	K	Basic	146.189
Arginine	R	Basic	174.203
Serine	S	Hydroxylic	105.093
Threonine	T	Hydroxylic	119.119
Methionine	M	Sulfur-Containing	149.208
Cysteine	C	Sulfur-Containing	121.154

- Automated Prediction
  - Each key amino acid is grouped into a “side chain class” and given a “size”.
- Evaluated based on Rules:
  - Same side chain class as query (Y/N)?
  - Size 30g/mol or less from query (Y/N)?
- If 2 “N” responses for  $\geq 1$  key amino acids then SeqAPASS predicts susceptibility of that species will differ from the query species.

## Level 3: Individual Amino Acid Residue Comparison

Example of how Level 3 Susceptibility Predictions work (hypothetical case study):

Protein	Shared Susceptibility	Position 1	Residue	Side Chain Class	Match	Size (MW)	Match
Mouse protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Human protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Bird protein	Yes	101	Y	Aromatic	Yes	181.191	Yes
Turtle protein	Yes	101	R	Basic	No	174.203	Yes
Frog protein	No	101	D	Acidic	No	133.104	No
Fish protein	No	101	N	Amidic	No	132.119	No
Insect protein	No	101	A	Aliphatic	No	89.094	No

## Level 3: Individual Amino Acid Residue Comparison

This example compares protein targets from 6 different species to Mouse as the query species.

Protein	Shared Susceptibility	Position 1	Residue	Side Chain Class	Match	Size (MW)	Match
Mouse protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Human protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Bird protein	Yes	101	Y	Aromatic	Yes	181.191	Yes
Turtle protein	Yes	101	R	Basic	No	174.203	Yes
Frog protein	No	101	D	Acidic	No	133.104	No
Fish protein	No	101	N	Amidic	No	132.119	No
Insect protein	No	101	A	Aliphatic	No	89.094	No

## Level 3: Individual Amino Acid Residue Comparison

This example has 1 key amino acid position, but most proteins have 10 to 20 key positions that are directly involved in protein-chemical interactions.

Protein	Shared Susceptibility	Position 1	Residue	Side Chain Class	Match	Size (MW)	Match
Mouse protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Human protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Bird protein	Yes	101	Y	Aromatic	Yes	181.191	Yes
Turtle protein	Yes	101	R	Basic	No	174.203	Yes
Frog protein	No	101	D	Acidic	No	133.104	No
Fish protein	No	101	N	Amidic	No	132.119	No
Insect protein	No	101	A	Aliphatic	No	89.094	No

## Level 3: Individual Amino Acid Residue Comparison

SeqAPASS compares the side-chain class of each amino acid from each species and whether it is a match to the query (mouse).

Protein	Shared Susceptibility	Position 1	Residue	Side Chain Class	Match	Size (MW)	Match
Mouse protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Human protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Bird protein	Yes	101	Y	Aromatic	Yes	181.191	Yes
Turtle protein	Yes	101	R	Basic	No	174.203	Yes
Frog protein	No	101	D	Acidic	No	133.104	No
Fish protein	No	101	N	Amidic	No	132.119	No
Insect protein	No	101	A	Aliphatic	No	89.094	No

## Level 3: Individual Amino Acid Residue Comparison

SeqAPASS compares the molecular weight of each amino acid from each species and whether the difference is less than 30 g/mol from query (mouse).

Protein	Shared Susceptibility	Position 1	Residue	Side Chain Class	Match	Size (MW)	Match
Mouse protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Human protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Bird protein	Yes	101	Y	Aromatic	Yes	181.191	Yes
Turtle protein	Yes	101	R	Basic	No	174.203	Yes
Frog protein	No	101	D	Acidic	No	133.104	No
Fish protein	No	101	N	Amidic	No	132.119	No
Insect protein	No	101	A	Aliphatic	No	89.094	No

## Level 3: Individual Amino Acid Residue Comparison

To provide conservative predictions, two “No” matches for one or more amino acids are required for SeqAPASS to predict that the species differ in susceptibility.

Protein	Shared Susceptibility	Position 1	Residue	Side Chain Class	Match	Size (MW)	Match
Mouse protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Human protein	Yes	101	F	Aromatic	Yes	165.192	Yes
Bird protein	Yes	101	Y	Aromatic	Yes	181.191	Yes
Turtle protein	Yes	101	R	Basic	No	174.203	Yes
Frog protein	No	101	D	Acidic	No	133.104	No
Fish protein	No	101	N	Amidic	No	132.119	No
Insect protein	No	101	A	Aliphatic	No	89.094	No

# APPLICATION OF SeqAPASS

Molecular target sequence similarity as a basis for species extrapolation to assess the ecological risk of chemicals with known modes of action

## Terms

- **Query protein sequence/species** – the initial sequence/species submitted to SeqAPASS
- **Hit protein sequence/species** – all sequences/species that align with the query sequence/species
- **Protein Accession** – A unique identification tag given to every protein in the NCBI databases (e.g., ACD123211.2; NP\_0000116.2)
- **Domain Accession** – A unique identification tag given to every protein domain in the NCBI Conserved Domain Databases (e.g., cd00891; pfam00067)
