

# An Update on Public Tools for Prediction of Endocrine Bioactivity

Chad Deisenroth, Keith Houck, Richard Judson, and Katie Paul Friedman

November 14, 2019

Presentation to EFSA colleagues

*The views expressed in this presentation are those of the authors and do not necessarily reflect the views or policies of the  
U.S. EPA*

ToxCast and Tox21 have generated a lot of publicly available bioactivity data for hazard screening and prediction.

## EPA's ToxCast program at a glance

Tox21 robot

- ToxCast: more assays, fewer chemicals, EPA-driven
- Tox21: fewer assays, all 1536, driven by consortium
- All Tox21 data are analyzed by multiple partners
- Tox21 data is available analyzed in the ToxCast Data Pipeline

# Endocrine hazard and risk evaluation using public tools: approach outline

- Publicly available data from ToxCast is actively being applied to endocrine hazard labeling in the EU.
- Risk-based approaches that incorporate bioactivity and exposure make the best use of new approach methodologies.

*This presentation will demonstrate where to find these information and suggest an approach for utilizing them in endocrine bioactivity and hazard evaluation.*

#### August 9th 2019 - New release (3.0.9) in time for ACS Fall Meeting

August 14th, 2019 at 4:39:37 PM

A new version of the Dashboard has been released in time for the ACS Fall meeting. Included in this release are updates to data in the ToxVal database, an update to the in vitro database ([version 3.2](#)), and the release also addresses a number of minor bugs and includes a short list of additional functionality as described in the [Release Notes here](#).

<https://comptox.epa.gov/dashboard>

# EPA's CompTox Chemicals Dashboard

- **A publicly accessible website delivering:**
  - ~875,000 chemicals with related property data
  - Experimental and predicted physicochemical property data
  - Integration to “biological assay data” for 1000’s of chemicals
  - Information regarding consumer products containing chemicals
  - Links to other agency websites and public data resources
  - “Literature” searches for chemicals using public resources
  - “Batch searching” for thousands of chemicals
  - Downloadable Open Data for reuse and repurposing
  - Many features (only highlighting a few)
  - Access to multiple tools (direct data interpolation and predictive) for multiple disciplines

<https://www.epa.gov/chemical-research/comptox-chemicals-dashboard>

Examine physicochemical properties such as logP, vapor pressure, and MW to get a better sense of whether the chemical was suitable for the current *in vitro* assay suite

Analytical chemistry: was the chemical present and in the DOA for current ToxCast?

ToxCast negatives: what does a negative mean? Outside of domain of applicability (DOA)?

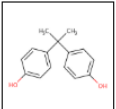

Many chemicals successfully screened fall within:  
logP -0.4 to 5.6 range;  
MW 180-480;  
Vapor Pressure < 1.

was the chemical  
present and in the  
DOA for current  
ToxCast?

# A note on ToxCast versioning

- Data change: curve-fitting, addition of new data
- Models change: improvements, more data, etc.
- The CompTox Chemicals Dashboard release from August 9, 2019 is now using ToxCast invitrodb version 3.2:  
<https://doi.org/10.23645/epacomptox.6062623.v4>
- All ToxCast data and endocrine models (CERAPP, COMPARA, ER, AR, steroidogenesis) can currently be accessed from within invitrodb.
- Data downloads for NCCT: <https://www.epa.gov/chemical-research/exploring-toxcast-data-downloadable-data>

# Endocrine models available via ToxCast and the Comptox Chemicals Dashboard

# Models >>> single assays. And equivocals happen.

>0.1 = positive; 0.001-0.1 = equivocal

| Model                                  | Receptor | Agonist       | Antagonist      | Binding       |
|--|----------|---------------|-----------------|---------------|
| ToxCast Pathway Model (AUC)            | Androgen | 0.00          | 0.345           | -             |
| ToxCast Pathway Model (AUC)            | Estrogen | 0.450         | 0.00            | -             |
| COMPARA (Consensus)                    | Androgen | Inactive      | Active          | Active        |
| CERAPP Potency Level (From Literature) | Estrogen | Active (Weak) | -               | Active (Weak) |
| CERAPP Potency Level (Consensus)       | Estrogen | Active (Weak) | Active (Strong) | Active (Weak) |

CERAPP = consensus ER QSAR (from 17 groups)

COMPARA = consensus AR QSAR (from 35 groups) (<https://www.researchgate.net/project/CoMPARA-Collaborative-Modeling-Project-for-Androgen-Receptor-Activity>)

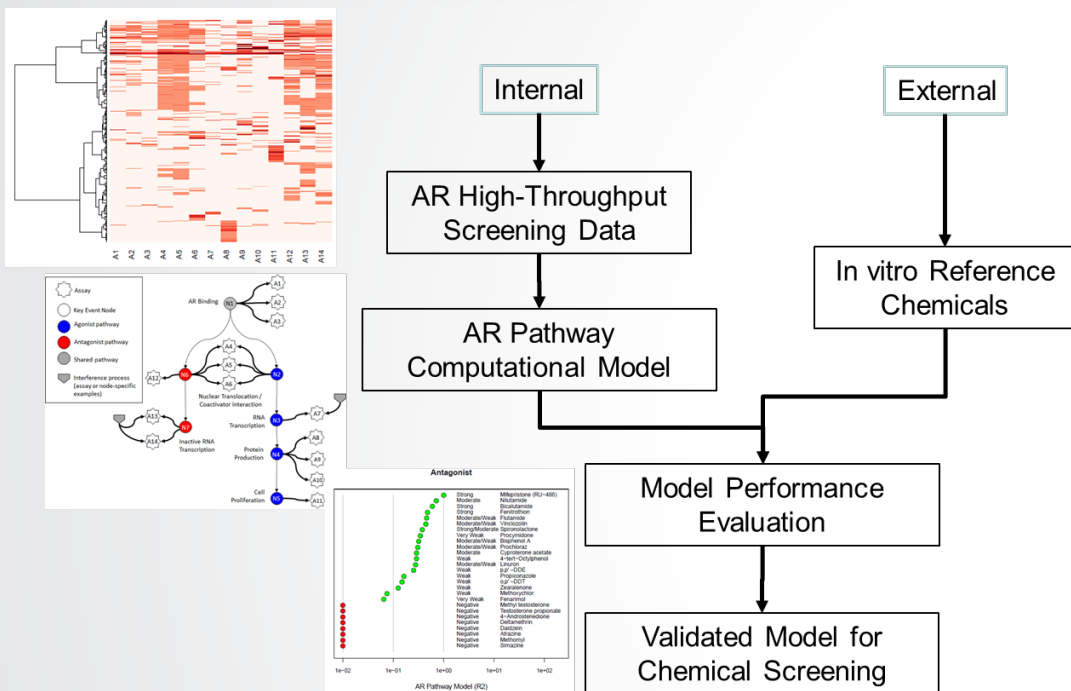

ToxCast Pathway Model AUC ER = full ER model (18 assays)

ToxCast Pathway Model AUC AR = full AR model (11 assays)

- The current model in the Dashboard is an update of the 2015 published model but still includes all 18 assays for agonist mode.
- This model has been accepted as an alternative for the ER binding, ER-TA, and Uterotrophic assays in the EDSP Tier 1 (<https://www.federalregister.gov/documents/2015/06/19/2015-15182/use-of-high-throughput-assays-and-computational-tools-endocrine-disruptor-screening-program-notice>).
- A newer publication describes how only 4 assays that cover key “receptors” or events in the activation of ER can achieve similar performance as the full model (<https://doi.org/10.1016/j.yrtph.2017.09.022>).
- OECD IATA proposal has been published and Defined Approach proposal being prepared

# ToxCast AR model

<https://doi.org/10.1021/acs.chemrestox.6b00347>

- Similar approach to the ToxCast ER model, but also original version included a confidence score due to the possibility for cytotoxicity interference in antagonist mode.
- Reviewed by Scientific Advisory Panels in 2014 and 2017.
- The Dashboard provides values from the original model published in 2016; a forthcoming paper will recalculate these values with additional assay data.
- The use of the uncertainty bounds around both the ER and AR model scores can be helpful in understanding weak or borderline scores.
- Both the ER and AR models are most helpful in understanding relative bioactivity.
- New version with more assays has been developed.

Endocrine models  
available?

## High-Throughput as an Alternative Characterization

Derik E. Hagg  
Richard S. Jud

\*Oak Ridge Institute  
Center for Computa  
Agency, Durham, N

- Supplemental File 4 has fold-change by hormone
- Supplemental File 9 has mMd (model values)
- Invitrodb v3.2 has a hth295r model table with both of these included in it.
- Hope to include this in future release of the Dashboard.

# Follow-up on the HT-H295R model in prioritization and bioactivity evaluation

Regulatory Toxicology and Pharmacology 109 (2019) 104510

Contents lists available at ScienceDirect

Regulatory Toxicology and Pharmacology

journal homepage: [www.elsevier.com/locate/yrtph](http://www.elsevier.com/locate/yrtph)

Development of a prioritization method for chemical-mediated effects on steroidogenesis using an integrated statistical analysis of high-throughput H295R data

Derik E. Haggard<sup>a,b</sup>, R. Woodrow Setzer<sup>b</sup>, Richard S. Judson<sup>b</sup>, Katie Paul Friedman<sup>b,\*</sup>

<sup>a</sup> Oak Ridge Institute for Science and Education, 100 ORAU Way, Oak Ridge, TN, 37830, USA

<sup>b</sup> National Center for Computational Toxicology, Office of Research and Development, U.S. Environmental Protection Agency, Research Triangle Park, NC, 27711, USA

- Data simulations suggest that covariances and variances among the 11 steroid hormones may be inherent to this assay.
- The mean Mahalanobis distance (mMd) approach demonstrated a false positive rate of less than 1%.
- The mMd approach has sufficient power to observe 1.5- to 2-fold changes in hormones and hormone combinations.
- Reference aromatase inhibitors were identified using the HT-H295R assay.
- A relative prioritization can be performed using cytotoxicity information and the maximum mMd.

- Evaluated the robustness, reproducibility, and power of the HT-H295R statistical model per feedback received at Scientific Advisory Panel review.
- Considered a case study: does the HT-H295R assay and model detect aromatase inhibitors?

Demonstrated the use of the HT-H295R statistical model in a selectivity-based prioritization exercise.

“Selectivity”: comparing bioactivity to a lower bound prediction of cell stress and cytotoxicity

# “Burst:” thinking and updates

Selective or non-selective?

- In the Comptox Chemicals Dashboard released March 7, 2019 (version 3.0.5), the cytotoxicity threshold was erroneously displayed as the median. The value that should have been displayed was the lower bound on the estimate of cytotoxicity. The median would appear much higher than the anticipated lower bound (note that both the median and lower bound values were in the ToxCast database, invitrodb). The Dashboard was subsequently corrected in a bug fix release (version 3.0.8, May 10, 2019) to again show the lower bound estimate for the cytotoxicity threshold.
- The latest Comptox Chemicals Dashboard release (version 3.0.9, August 9, 2019) demonstrates a cytotoxicity threshold based on the latest ToxCast database (invitrodb version 3.2, released August 2019). This value can change as more cytotoxicity data become available or curve-fitting approaches for existing data change.
- In invitrodb version 3.2, 88 assays are considered for the cytotoxicity threshold. A positive hit must be observed in 5% of these assays (noting that not all chemicals are screened in all 88 assays) in order to assign a cytotoxicity threshold. The cytotoxicity threshold is a median of AC50 potency values from the N assays with a hit. The cytotoxicity threshold visualized in the Dashboard is a lower bound on this estimate, calculated as the median cytotoxicity potency minus 3 times the global median absolute deviation. This is discussed further in a publication ([10.1093/toxsci/kfw148](https://doi.org/10.1093/toxsci/kfw148)) and the ToxCast Pipeline R package (tcpl) function, tcplCytoPt() (available on CRAN: <https://cran.r-project.org/web/packages/tcpl/index.html>). If fewer than 5 cytotoxicity assays demonstrate a positive hit, a default of 1000 micromolar is assigned for the chemical.
- The lower bound estimate of the cytotoxicity threshold or “burst” is useful context for ToxCast results. Bioactivity observed below the cytotoxicity threshold may represent more specific activity that is less likely to be confounded by cytotoxicity.
- It is possible that AC50 values above the cytotoxicity threshold are informative. If an assay has a parallel cytotoxicity assay in the same cell type, that may be more informative for interpreting that assay. Or, if a result is consistent with an AOP relevant to the chemical with assay AC50 values above and below the cytotoxicity threshold, those data may be meaningful.

# User application dictates “selectivity”

Selective or non-selective?

- $AC_{50} < \text{burst?}$
- $AC_{50} \text{ } 0.5\log_{10} \text{ distance from burst?}$
- $AC_{50} < \text{parallel viability assays?}$
- How else to filter ToxCast data: 3+ caution flags & hit-percent
- Other related ideas:
  - What other assays appear active in a similar concentration range?
  - Is there consistent support for MOA(s), or is it nonspecific activity?

# The future: metabolism retrofitting and the ToxCast AR minimal assay model

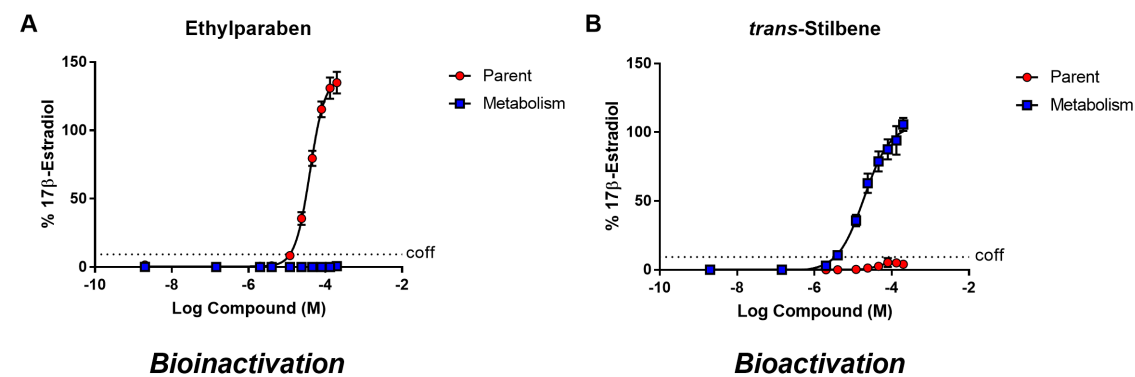

# Retrofitting Metabolism to an Estrogen Receptor Transactivation Assay

AIME Method: S9 fraction immobilization in alginate microspheres on 96- or 384-well peg lids

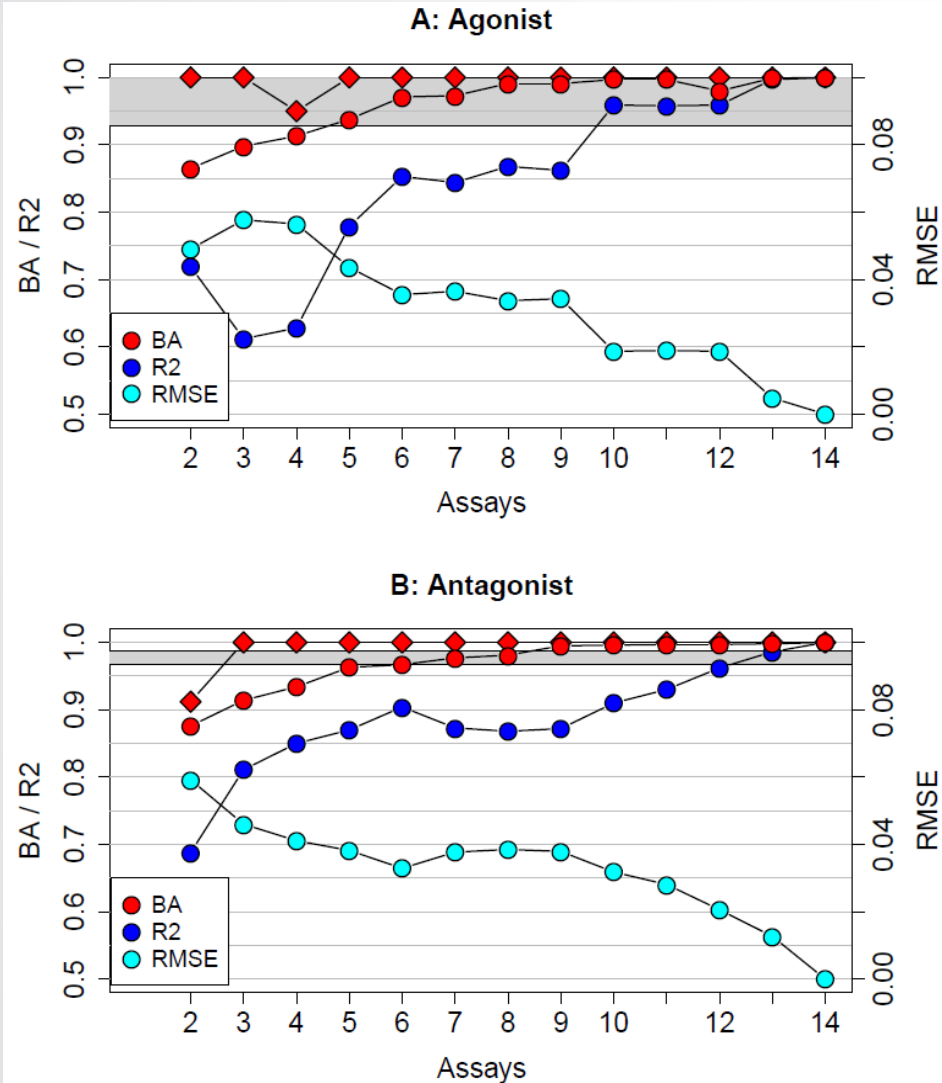

- **Retrofitting Metabolism:** AIME method suitable for biochemical- and cell-based HTS assays
- **Screening Throughput:** Adaptable to 96- and 384-well screening platforms
- **Regulatory Relevance:** Integration of phase I liver metabolism for hazard identification of parent and metabolite endocrine activity
- **Results:** Evaluation of a 63 chemical test set supports metabolic screening for -
  - Refinement of prioritization for ER-active substances based on metabolite effects
  - In some cases, supports more accurate prediction of *in vivo* effects for biotransformed substances

Parallel evaluation of parent compound and metabolites identifies false positive and false negative effects

# Judson and colleagues: ToxCast AR minimal assay model

- Agonist batteries of as few as seven assays and antagonist batteries of as few as five assays can yield balanced accuracies of 95% or better relative to the full model.
- These subset models are evaluated against 1820 chemicals evaluated in the full model, as well as *in vitro* and *in vivo* reference chemicals derived from the literature.
- An approach is outlined for researchers to develop their own subset batteries to accurately detect AR activity using assays that map to the pathway of key molecular and cellular events involved in chemical-mediated AR activation and transcription factor activity.
- This work follows up on suggestions from the 2017 Scientific Advisory Panel review of the full ToxCast AR model.

- Two IATAs using ER modeling have been published by OECD
- Case Study 309: The ER pathway model and subset versions (EPA)
  - [http://www.oecd.org/officialdocuments/publicdisplaydocumentpdf/?cote=ENV/JM/MONO\(2019\)28&docLanguage=en](http://www.oecd.org/officialdocuments/publicdisplaydocumentpdf/?cote=ENV/JM/MONO(2019)28&docLanguage=en)
- Case Study 290: Use of ER modeling for Hindered Phenols (led by Health Canada)
  - [http://www.oecd.org/officialdocuments/publicdisplaydocumentpdf/?cote=ENV/JM/MONO\(2018\)26&docLanguage=En](http://www.oecd.org/officialdocuments/publicdisplaydocumentpdf/?cote=ENV/JM/MONO(2018)26&docLanguage=En)
- IATA for AR model and subsets in preparation
  - Follows the ER model IATA closely
- Defined Approach (DA) for the ER model being planned
  - Partners: EPA, EFSA, NICEATM, JRC
  - Will include both in vitro assays and QSAR model

- Understanding the analytical quality control of samples screened in ToxCast/Tox21 and the amenability of the substance for current *in vitro* screens can be informative.
- *In silico* QSARs for xenobiotic-modulated ER and AR activity are available; these predict binding and agonist/antagonist modes based on sub-model consensus.
- ToxCast ER and AR models evaluate ER and AR agonism and antagonism based on HTS bioactivity assays for binding, cofactor recruitment, translocation, transcription factor activity, and in the case of ER, ER-dependent cell proliferation. These models also consider sources of interference, including cytotoxicity. Thus these models represent a more integrated and superior hazard prediction to single assays alone.
- The ToxCast HT-H295R model has been reviewed by a Scientific Advisory Panel and published in a trilogy of papers on the methods, modeling and comparison to the interlaboratory validation of the H295R assay, and then evaluation and use of the model in prioritization.
- The ToxCast ER and AR models are proceeding through OECD processes for development of IATAs and DAs.
- Future improvements to modeling approaches including metabolism are being developed.

# Acknowledgments

- Thank you for listening.
- Please reach out to us if you need support or explanations for a specific case, or if you find issues.

# Appendix slides on IVIVE and risk using publicly available tools

## Steady state in vitro-in vivo extrapolation assumption: blood::tissue partitioning $\approx$ cells::medium partitioning

$$C_{ss} = \frac{\text{oral dose rate}}{(GFR * F_{ub}) + \left( Q_l * F_{ub} * \frac{Cl_{int}}{Q_l + F_{ub} * Cl_{int}} \right)}$$

Wetmore *et al.* (2012)

- Swap the axes (this is the “reverse” part of reverse dosimetry)
- Can divide bioactive concentration by  $C_{ss}$  for a 1 mg/kg/day dose to get oral equivalent dose

# IVIVE via high-throughput toxicokinetic data and models

Identification of a potency value to use for IVIVE of a threshold dose

- Operationally, the httk R package (v 1.10.0) can be downloaded from CRAN or GitHub for reproducible generation of administered equivalent doses (AEDs)
- For some substances, there is a beta tab in the Dashboard with C<sub>ss</sub> and other values needed (no models). More chemicals have information in the httk package.
- AC<sub>50</sub> or LEC (micromolar) \* (1 mg/kg/day/C<sub>ss</sub> (micromolar)) = AED prediction
- Httk package optionally implements multiple models that can have increasing complexity based on data available

# Consensus modeling of chemical exposure based on pathways: ExpoCast SEEM3

- “ExpoCast SEEM3” model:
  - uses twelve different exposure predictors including both near- and far-field models;
  - covers four distinct exposure pathways: non-pesticidal dietary, consumer products, far-field pesticide, and far-field industrial.
  - In SEEM3 each exposure predictor is scaled and centered such that chemicals without a value for a predictor relevant to its exposure pathways are assigned the average value.
