# Overview

---

- **Background**

- NAMs-based Tiered Toxicity Testing Strategy
- TempO-Seq Assay for High-Throughput Transcriptomics (HTTr) Screening
- CCTE HTTr Data Landscape
- CCTE HTTr Bioinformatics Pipeline

- ***In Vitro* Screening Studies**

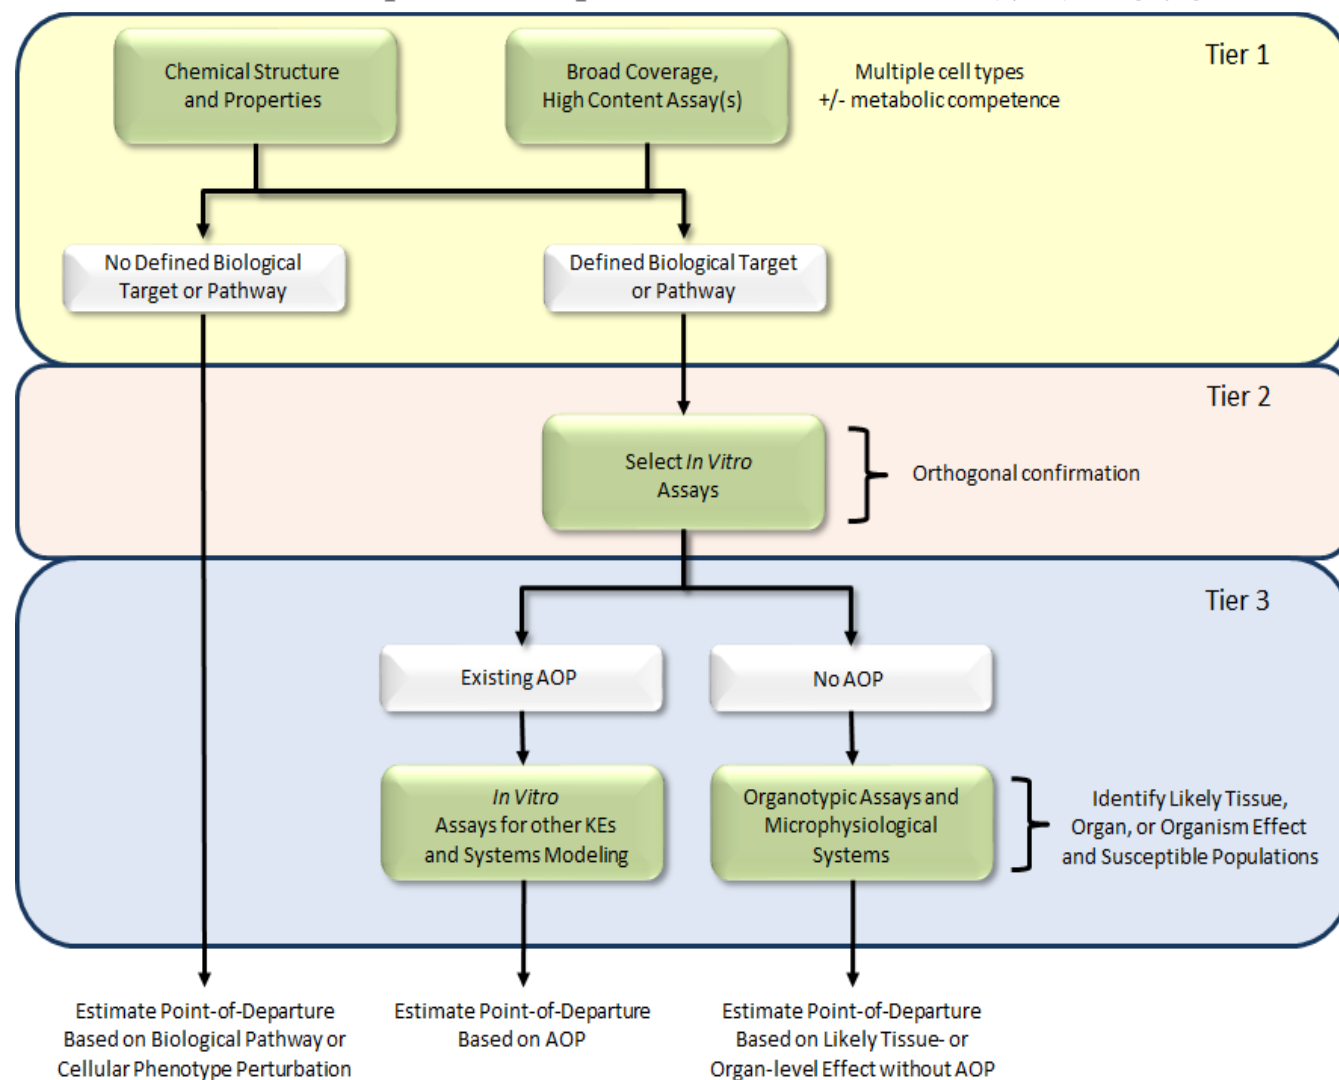

- Volatiles Screening
- HTTr Screening of APCRA Case Study Chemicals.

# NAMs-based Tiered Toxicity Testing Strategy

- **New Approach Methodologies (NAMs)** are any technology, methodology, approach or combination thereof that can be used to provide information on chemical hazard and risk that avoids the use of intact animals.
- Increasing efficiency and declining cost of generating whole transcriptome profiles has made **high-throughput transcriptomics (HTTr)** a practical NAM for *in vitro* chemical screening.
- The resulting data can potentially be used for **potency estimation, mechanistic prediction** and evaluation of **chemical similarity**.

The NexGen Blueprint of CompTox as USEPA Tox. Sci. 2019; 169(2):317-322

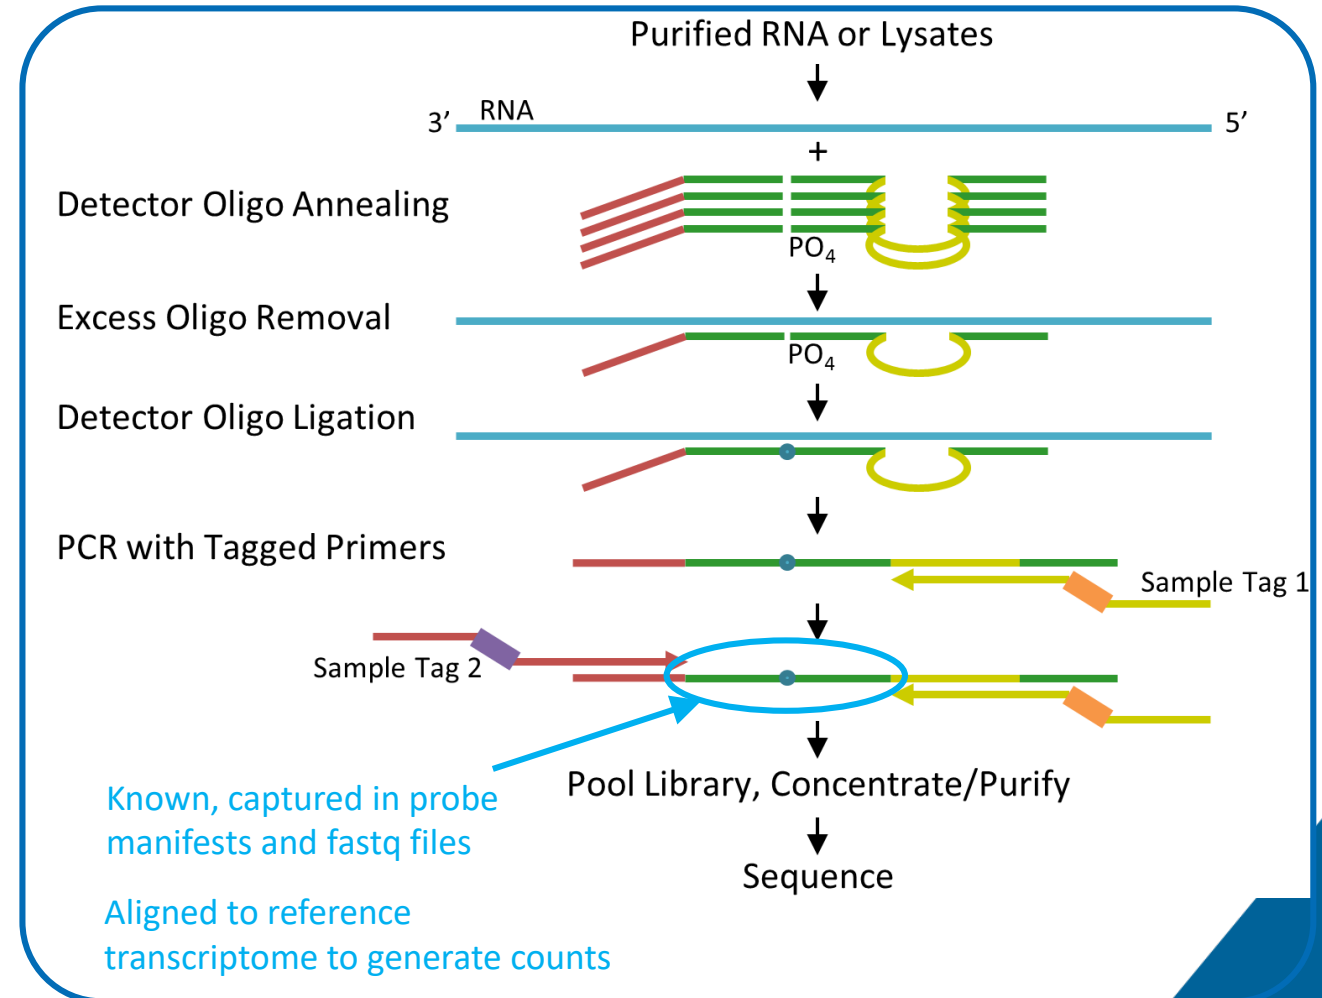

# Templated Oligo with Sequencing Readout (TempO-Seq)

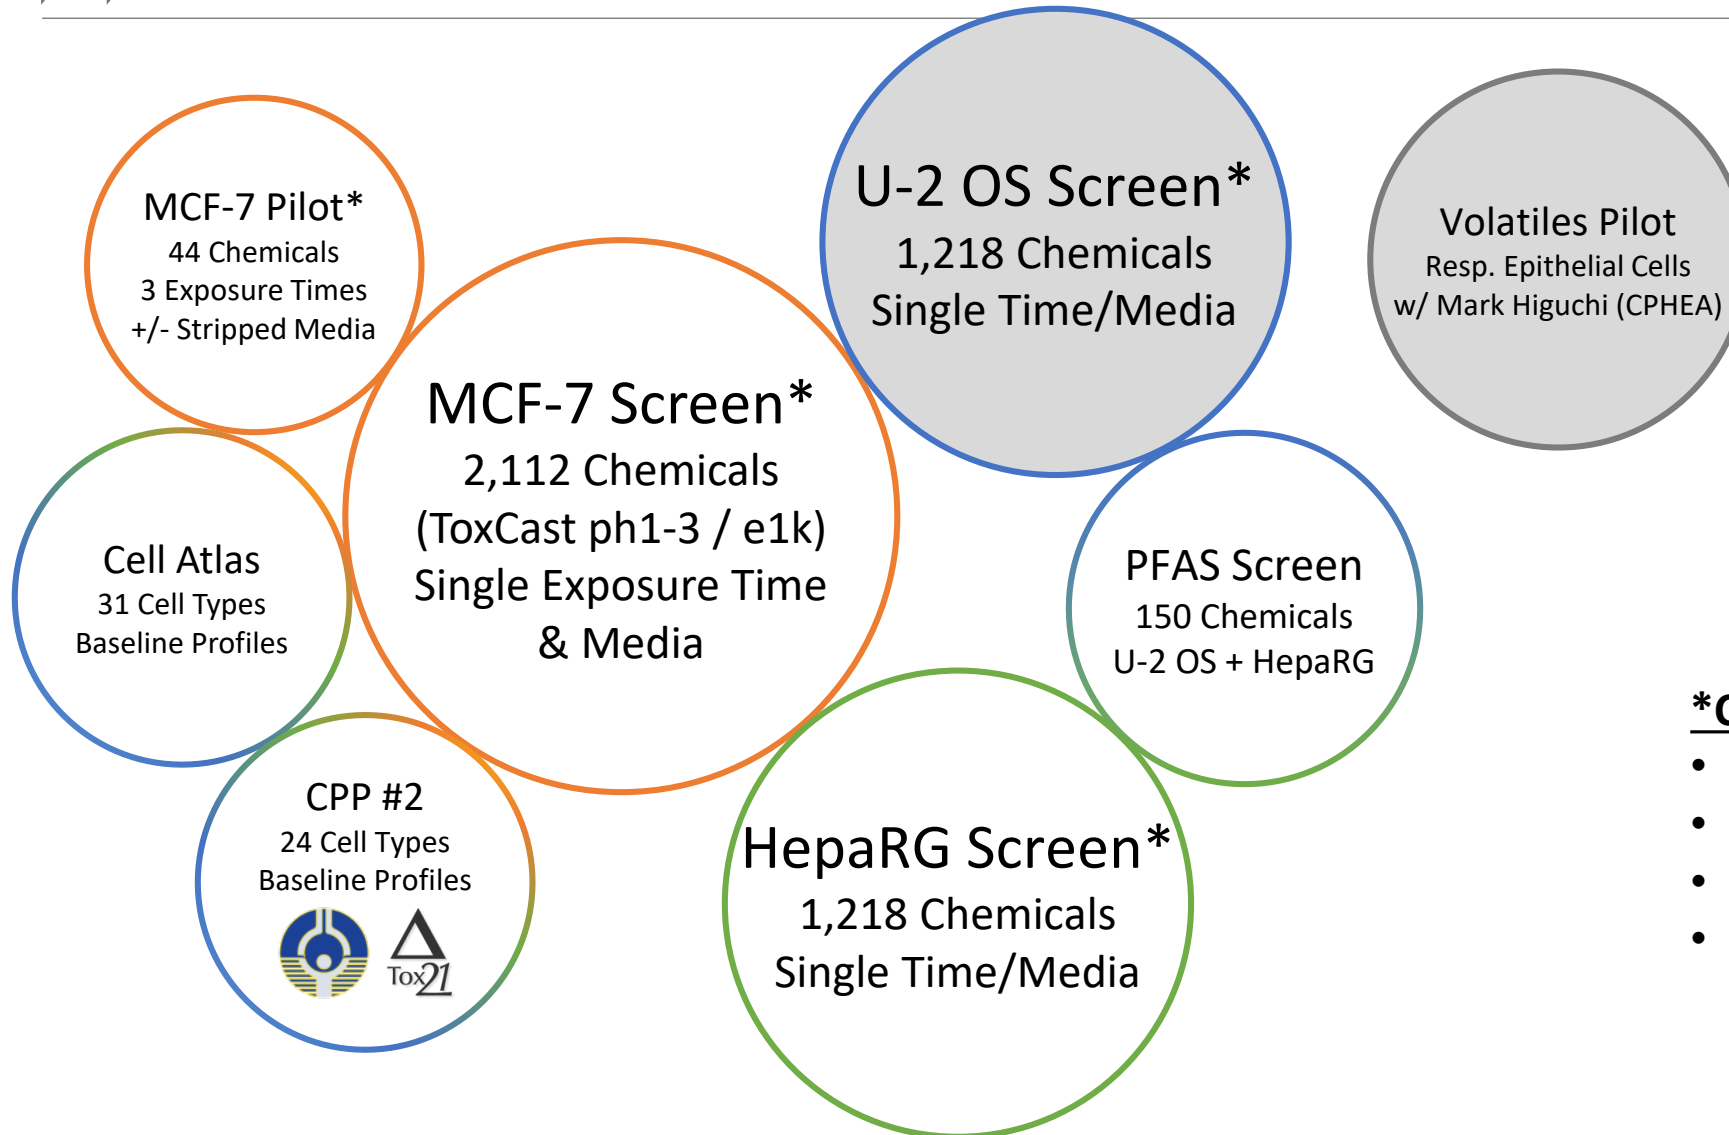

- The **TempO-Seq** human whole transcriptome assay measures the expression of greater than 20,000 transcripts.
- Requires only picogram amounts of total RNA per sample.
- Compatible with purified RNA samples or **cell lysates**.
- Lysates are barcoded according to sample identity and combined in a single library for sequencing using industry standard instrumentation.
- Scalable, targeted assay:
  - 1) specifically measures transcripts of interest
  - 2) ~50-bp reads for all genes
  - 3) requires less flow cell capacity than RNA-Seq

## TempO-Seq Assay Illustration

# HTTr Data Landscape at US EPA

## **\*Chemical Exposures:**

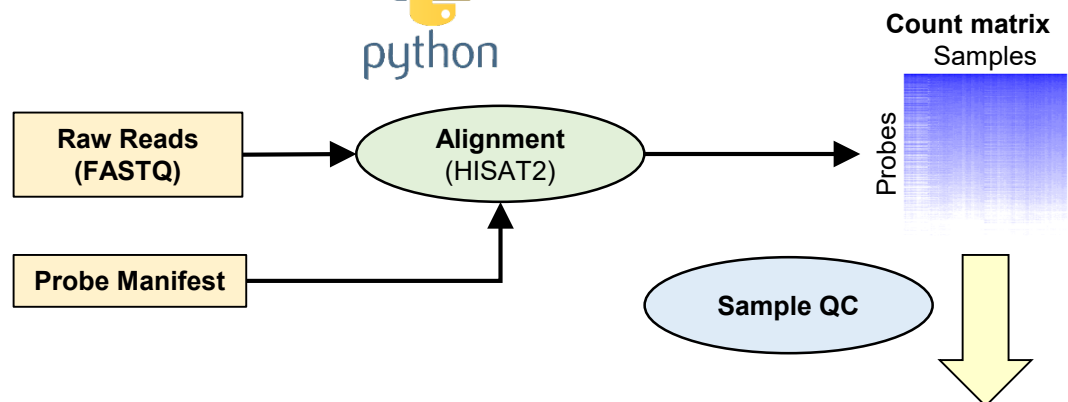

- 8 Concentration Series
- Regular Log10 Spacing
- 3 Replicates per Conc
- Randomized Plate Layout

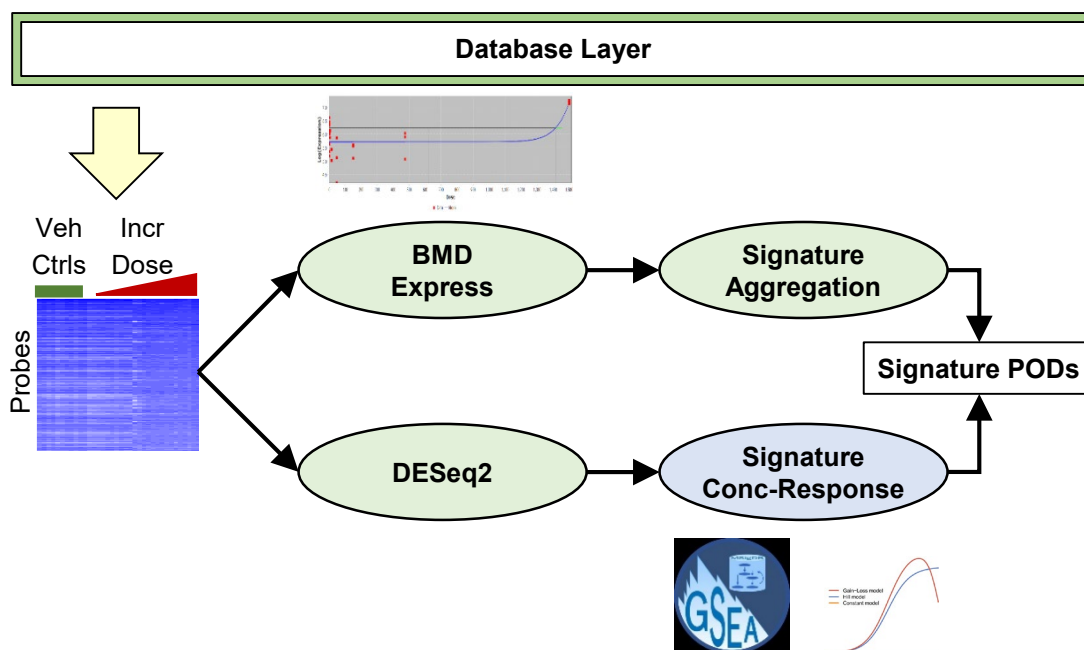

# HTTr Bioinformatics Pipeline

Raw Data Processing

Single Chemical Analysis

- Code managed with git/BitBucket
- Database layer helps manage larger screens, protect/backup data
- Many data steps performed independently for each test chemical:
  - Removal of low signal probes
  - Normalization
  - DESeq2 analysis

# *In Vitro* HTTr Screening of Volatile Chemicals

Direct exposure of human-derived cells cultured at air-liquid interface (ALI) to volatile chemicals to generate molecular point-of-departures (POD)

Experimental Design	Description
Cell Types	Primary Human Bronchial Epithelial Cells* BEAS-2B cells
Test Chemical	1,3-Butadiene Acrolein Formaldehyde Acetaldehyde Trichloroethylene* 1-Bromopropane* Carbon Tetrachloride* Dichloromethane*
Exposure Regimen	<ul style="list-style-type: none"><li>6 concentrations, sham control, incubator control</li></ul>
Exposure Duration	<ul style="list-style-type: none"><li>2 hours, Assays conducted 4h post exposure</li></ul>
Technical Replicates	<ul style="list-style-type: none"><li>TempO-Seq, n=2; Viability, n=2; Cytotoxicity, n=4</li></ul>
Biological Replicates	<ul style="list-style-type: none"><li>Exposures per cell type conducted over three days, n=3</li></ul>
Assay Formats	<ul style="list-style-type: none"><li>TempO-Seq</li><li>Cytotoxicity [LDH Release, Cell Titer Glo]</li></ul>

# Cell Culture Exposure System (CCES)

## Pre-exposure

- All cells grown at ALI
- Apical side **washed** and given fresh media 2h prior to exposure
- HEPES buffered media to maintain pH in low CO<sub>2</sub> environment

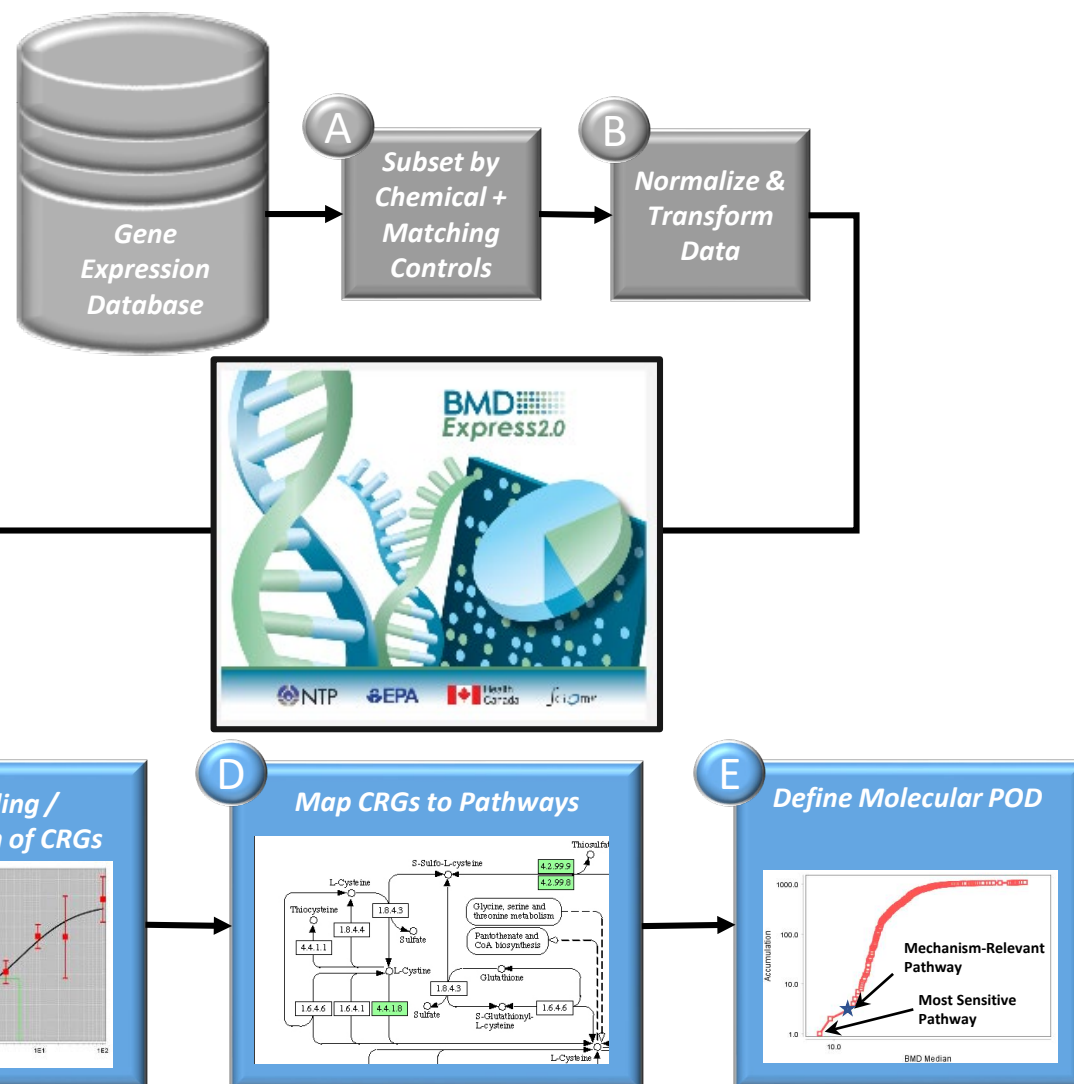

## Post-exposure

- VOC exposure for 2h
- Cells removed from CCES and samples collected 4h post-exposure

# Concentration-Response Modeling (BMDExpress)

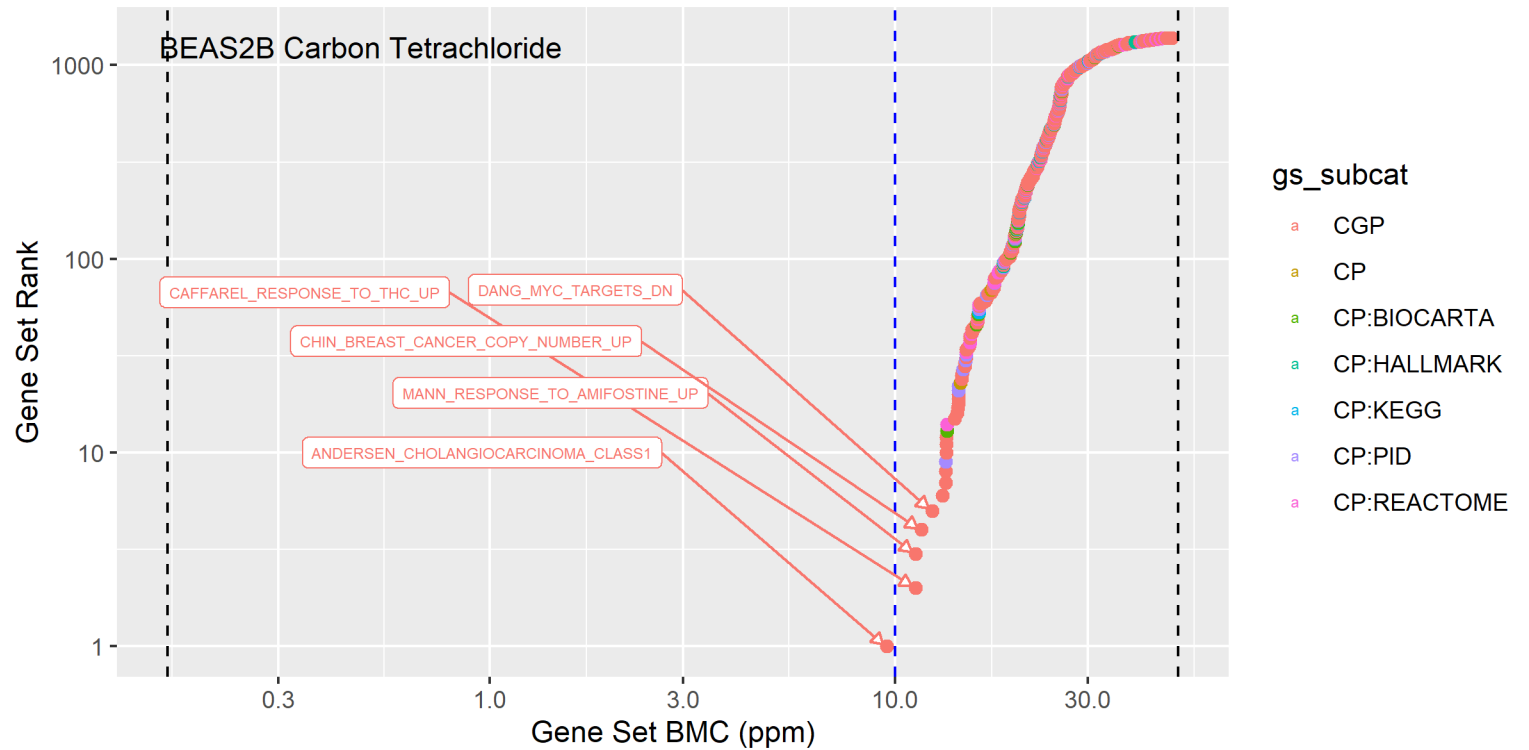

Based on National Toxicology Program Approach to Genomic Dose-Response Modeling (NTP RR 5)

BMDExpress Parameter	Criteria
<b>Pre-filter:</b>	$ FC  > 2$ at any test concentration
<b>Models</b>	Hill, Power, Linear, Poly2, Exponential 2 3 4 5
<b>BMR Factor:</b>	$1.349 * SD$ of controls (10%)
<b>Best Model Selection:</b>	Lowest AIC
<b>Hill Model Flagging:</b>	'k' < 1/3 Lowest Positive Dose Exclude Flagged Hill Models from Best Model Selection
<b>Conc-Response Hit Criteria</b>	$(0.1 * \text{lowest conc.} < BMC < \text{highest conc.})$ BMC fit p-value > 0.1 $BMCL / BMCU < 40$
<b>Pathway Analysis:</b>	$\geq 3$ Concentration-responsive genes $\geq 5\%$ Gene Set Coverage
<b>Gene Set Collections:</b>	Molecular Signatures Database (v7)

Adapted from Harrill et al. (2019)

# Example of BMDEExpress Modeling Output

Black Dashed Lines = Min. and Max. Test Concentrations  
Blue Dashed Line = TLV (ppm)

# Comparison of Molecular PODs from Volatiles Testing to Industrial Hygiene Standards

	ACGIH TLV-TWA (ppm)	BEAS-2B HTTr POD (ppm)	HBEC HTTr POD (ppm)
Acrolein	0.1	0.58	--
Formaldehyde	0.3	NA	--
1,3-Butadiene	10	13.98	--
Acetaldehyde	25	NA	--
1-Bromopropane	0.1 *	2.25	NA
Carbon Tetrachloride	10	9.56	NA
Trichloroethylene	50	44.8	28.1
Dichloromethane	100	142.13	266.7

In 5 of 6 cases where a POD could be determined, that value was very close to the ACGIH TLV-TWA value.

The exception was 1-bromopropane

\* The ACGIH TLV TWA for 1-bromopropane was updated to 0.1 ppm in 2012. Prior to that the TLV-TWA for 1-bromopropane was 10 ppm.

# HTTr Screening Study Design

Parameter	Multiplier	Notes
Cell Type(s)	1	U-2 OS
Culture Condition	1	DMEM + 10% HI-FBS
Chemicals	1,218	Selected from ToxCast Collection Includes 462 APCRA case study chemicals
Time Points:	1	24 hours
Assay Formats:	2	High Throughput Transcriptomics (TempO-Seq) High Throughput Phenotypic Profiling (Cell Painting)
Concentrations:	8	3.5 log <sub>10</sub> units; ~half-log <sub>10</sub> spacing
Biological Replicates:	3	--

Accelerating the Pace of Chemical Risk Assessment

Kavlock et al. (2018)  
*Chem. Res. Tox.*; 31(5): 287-290

- International collaboration of regulatory scientists focused on developing case studies for evaluating the use of New Approach Methodologies (NAMs) in chemical risk assessment.
- ECHA Workshop (2017) case study focuses on **deriving quantitative estimates of risk based on NAM-derived potency information and computational exposure estimates**

# Concentration-Response Modeling of Signature Scores

## Step 1: Inputs

**Experimental Data:** Chemical\_Conc  $\times$  Gene matrix of  $\log_2$  (fold-change) (l2fc) values.  
**Signature Collections:** MSigDB (*Liberzon et al. 2015*), BioPlanet (*Huang et al. 2019*), CMAP (*Subramanian et al. 2005*)

## Step 2: Pathway Scoring

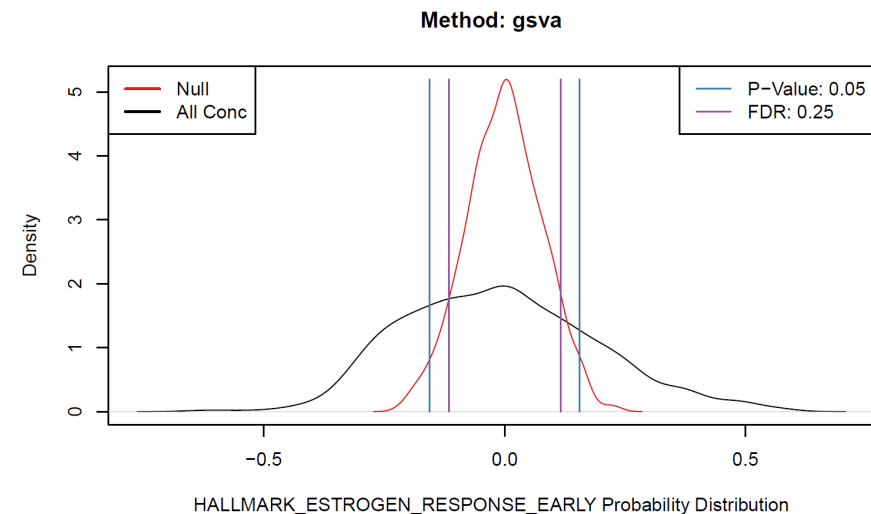

Scores based on single sample GSEA method (Barbie et al. 2009)

*Chemical\_Conc  $\times$  Pathway matrix of scores.*

## Step 3: Cut-off Estimation via NULL Modeling

- For each gene, **resample** l2fc based on the cross-sample gene distribution  $\rightarrow$  breaks gene correlation
- Calculate **pathway scores for “null” data**
  - One null distribution (n = 1000 scores) / pathway

# Concentration Response Modeling Example

## Step 4: CR Modeling

Concentration response modeling of signature scores using tcplfit2 (Sheffield et al. *submitted*)

- Takes into account coordinated changes in gene expression that may not be identified using gene level fitting approaches.
- All curve forms from BMDExpress, plus constant model.
- Provides continuous hit calls for identifying high confidence and low confidence hits.

# Bioactivity-to-Exposure Ratio Analysis

## Summary and Conclusions

---

- **Volatiles:** “Acute” *in vitro* screening of volatile chemicals using air liquid interface and HTTr yielded potency values approximating occupational exposure limits.
- **APCRA Chemicals:** Concentration-response modeling of HTTr signature scores in U-2 OS cells yielded molecular PODs that were positively correlated with molecular PODs from ToxCast.
- **Bioactivity Exposure Ratio:** *In vitro* to *in vivo* extrapolation of molecular PODs facilitated comparison to predicted human exposure estimates and ranking based on bioactivity exposure ratios.
