# Drivers for EPA Research Initiatives

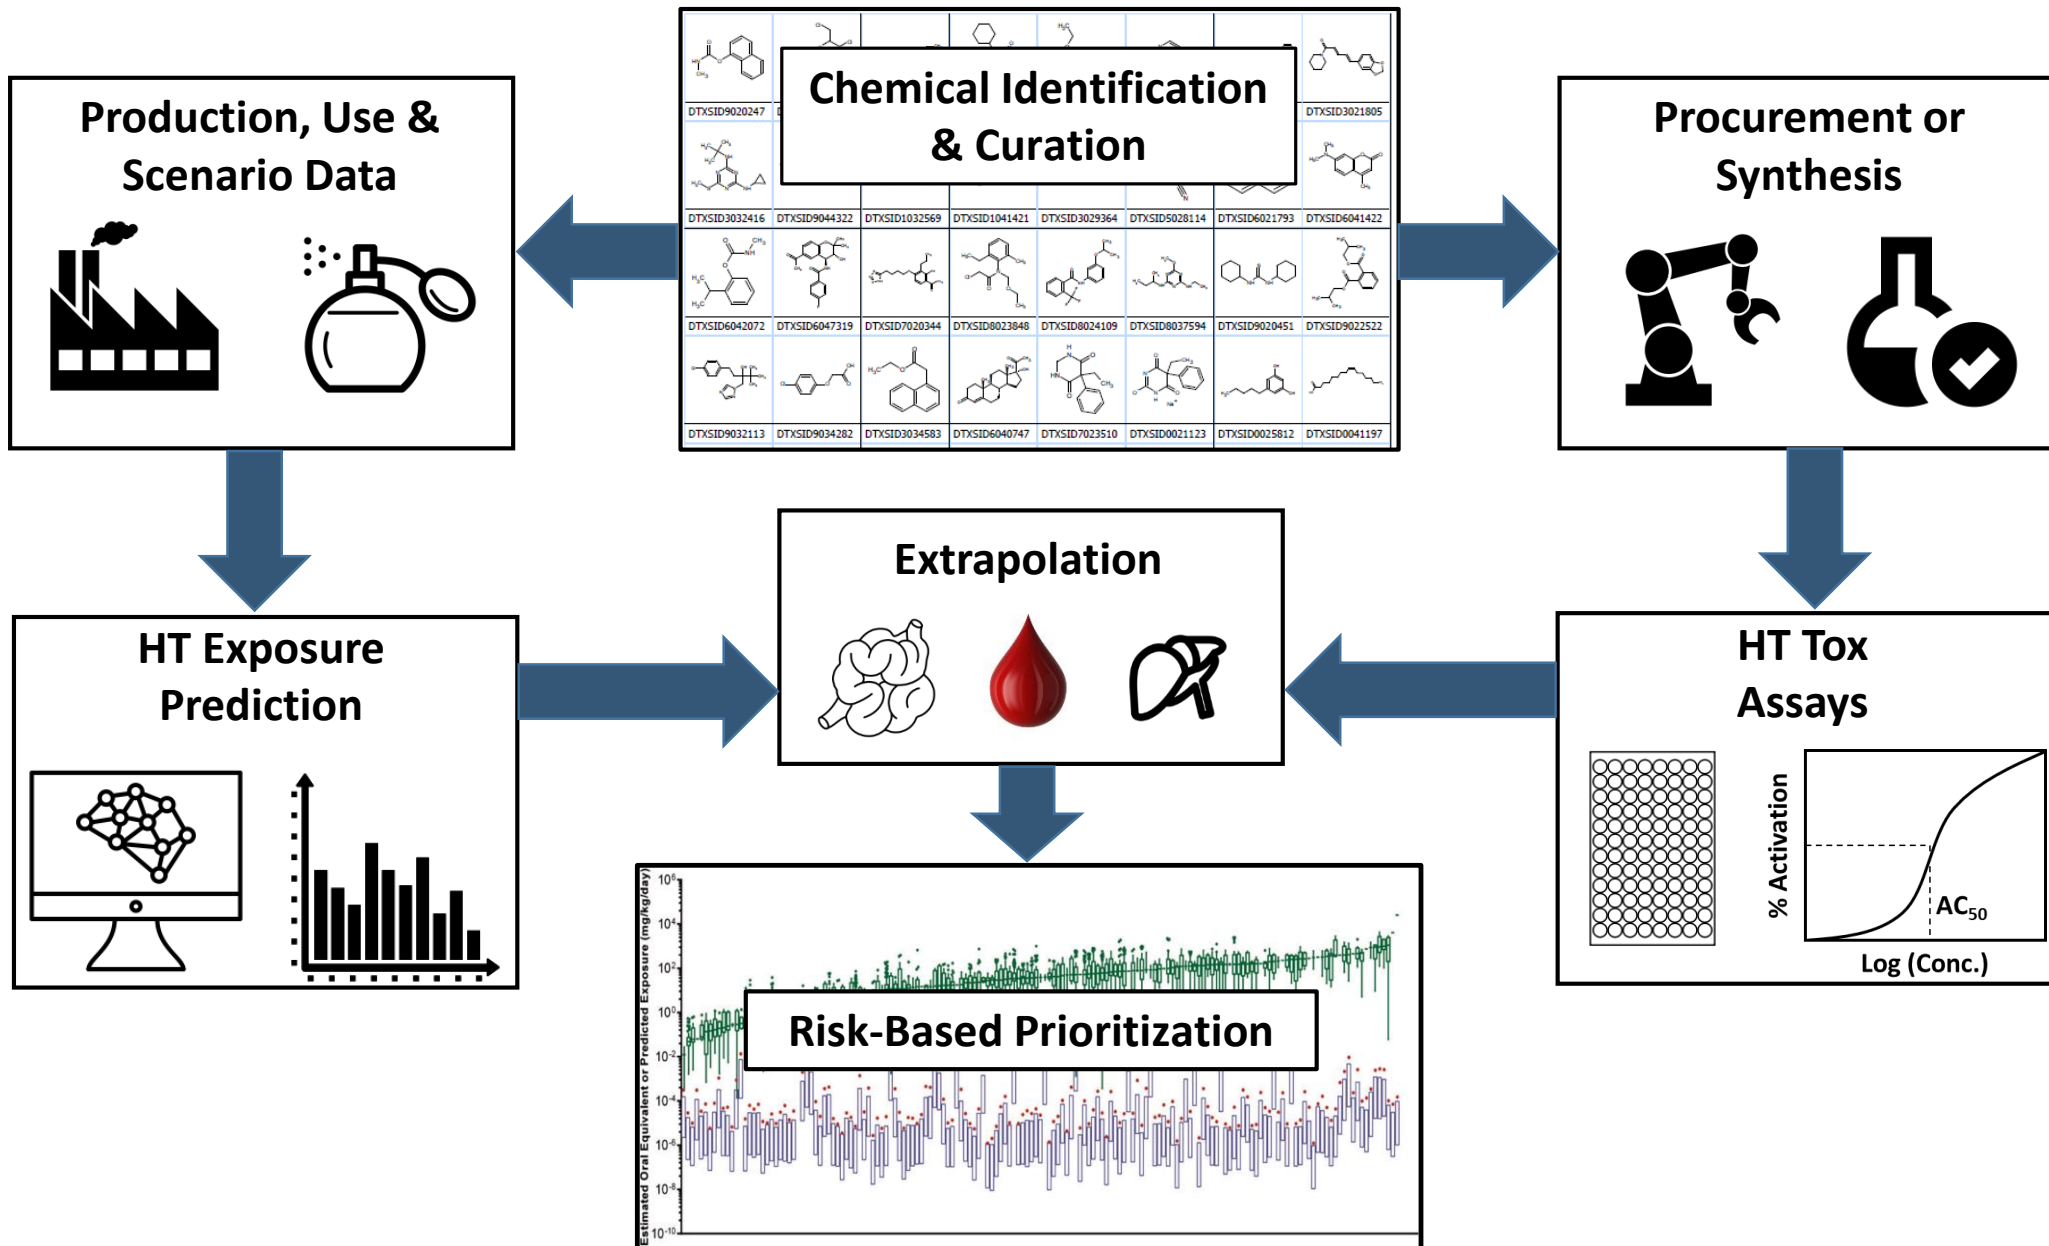

- Many industrial & commercial chemicals are covered by the Toxic Substances Control Act (TSCA), which is administered by EPA.
- TSCA updated in June 2016 to allow *risk-based* evaluation of existing and new chemicals.
- Characterization of risk requires exposure and hazard data.
- EPA's Office of Research and Development (ORD) is developing new approach methodologies (NAMs) for rapid risk characterization.

# The Era of High-Throughput Assessments

(ExpoCast)

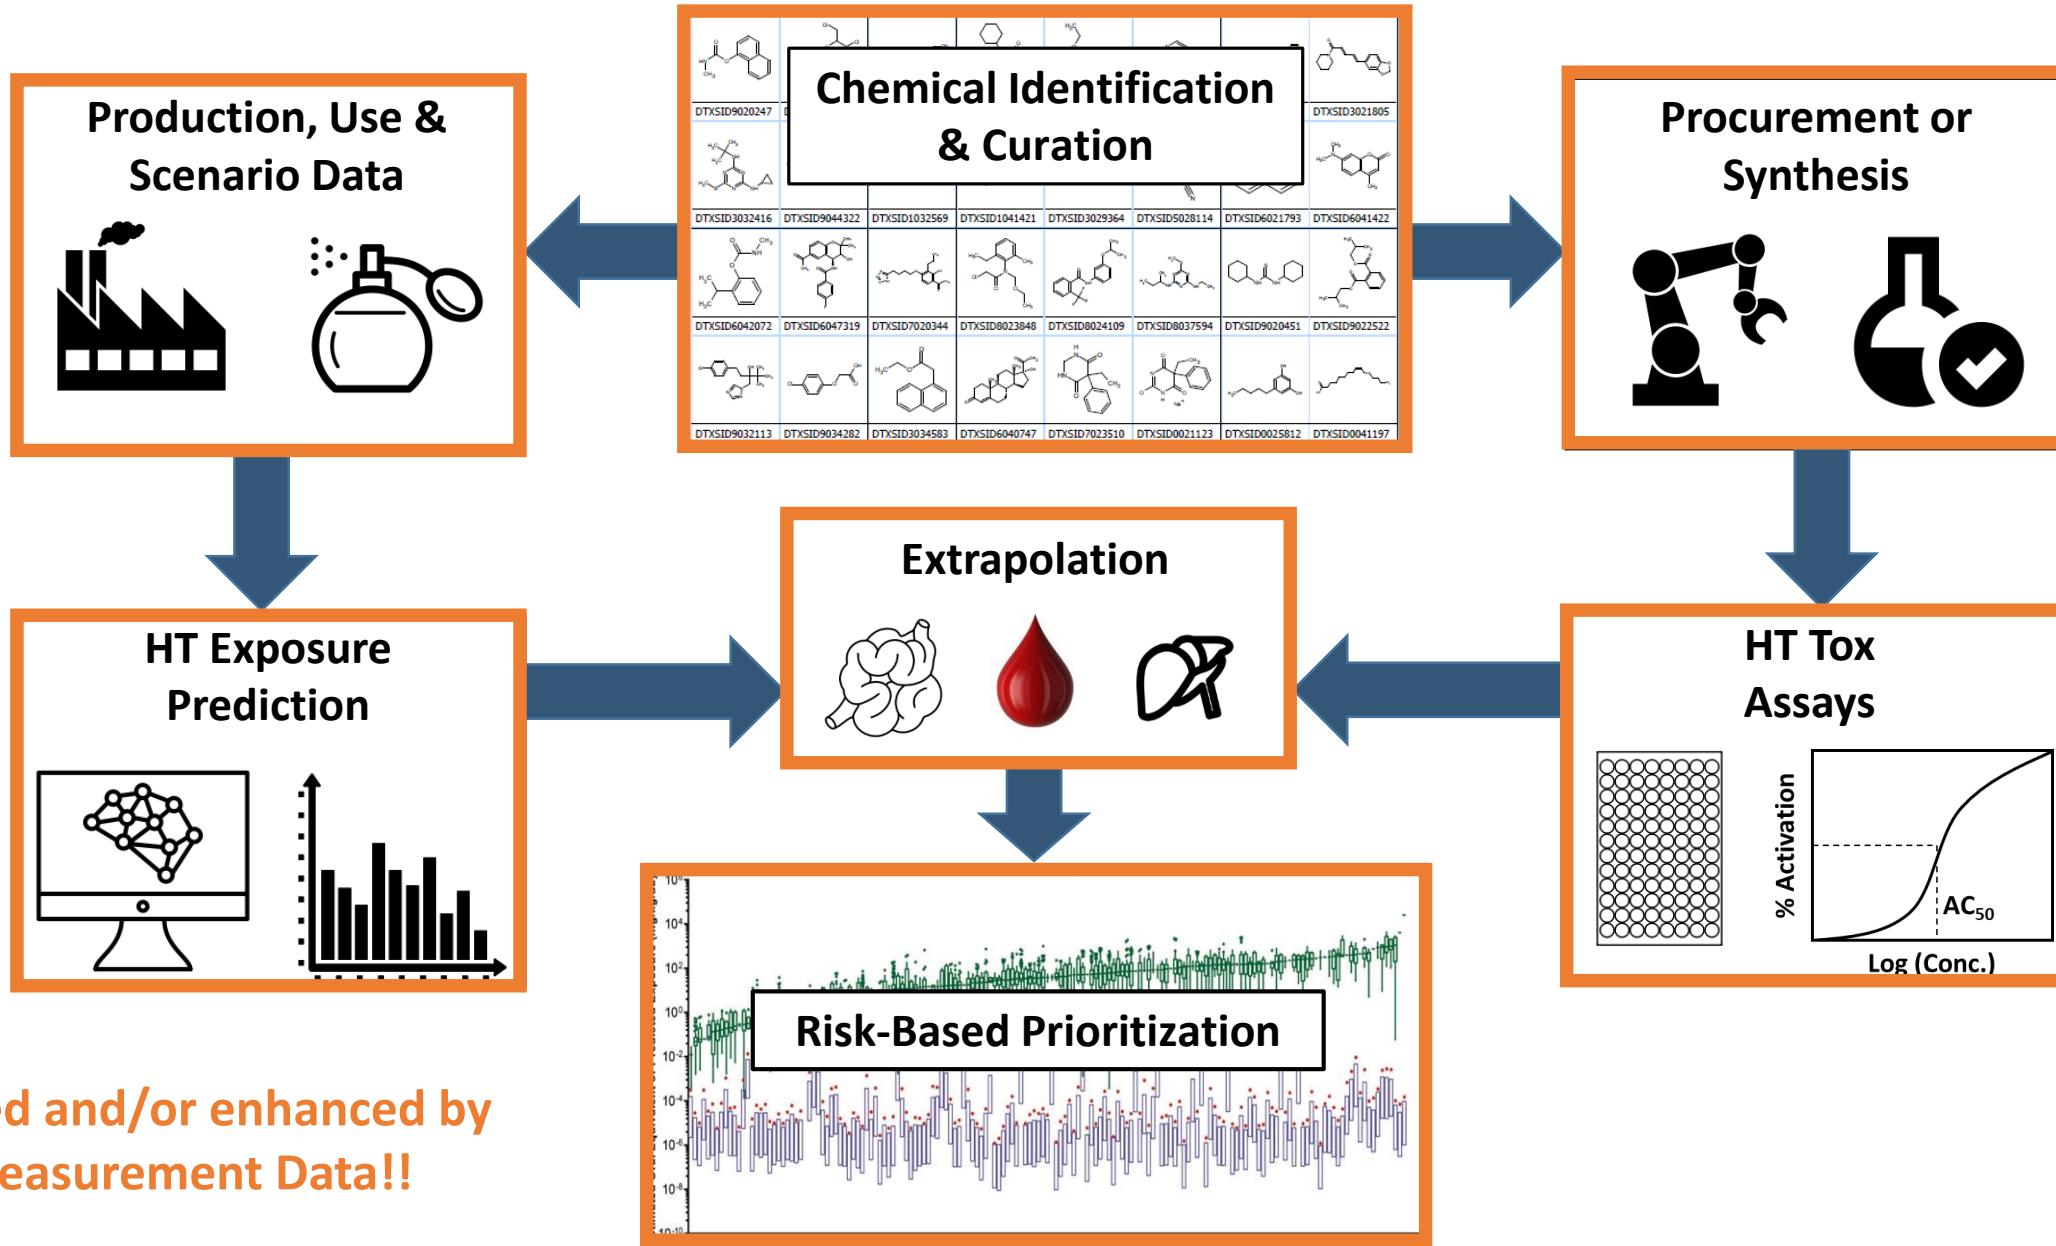

Toxicity Forecasting  
(ToxCast)

# The Era of High-Throughput Assessments

Exposure Forecasting  
(ExpoCast)

Toxicity Forecasting  
(ToxCast)

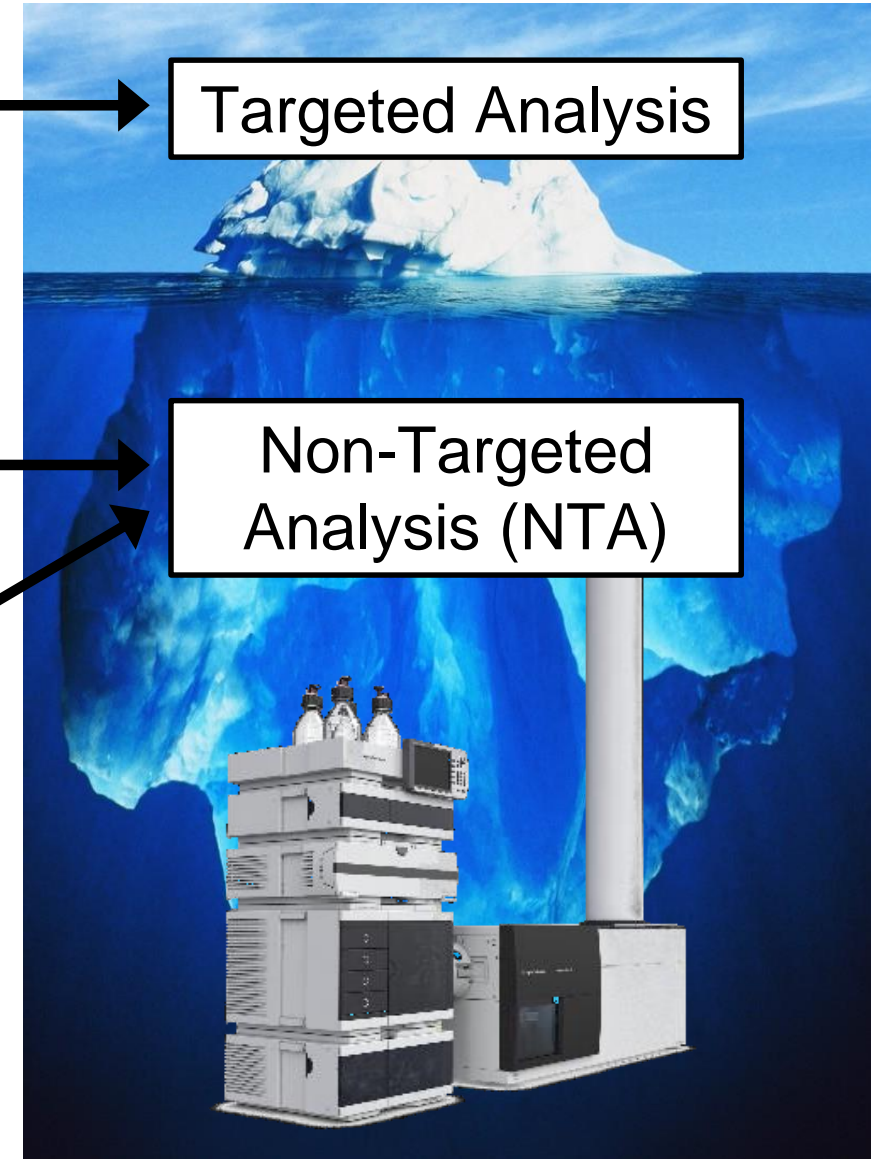

Guided and/or enhanced by  
Measurement Data!!

# The Need for Chemical Measurement Data

- Well-known chemicals
  - 100s - 1,000s (e.g., NHANES)
  - Quality exposure data
- Known but data-poor chemicals
  - 1,000s - 1,000,000s (e.g., TSCA)
  - Limited exposure data
- Chemicals not yet known to exist
  - Unknown #
  - No exposure data

Targeted Analysis

Non-Targeted  
Analysis (NTA)

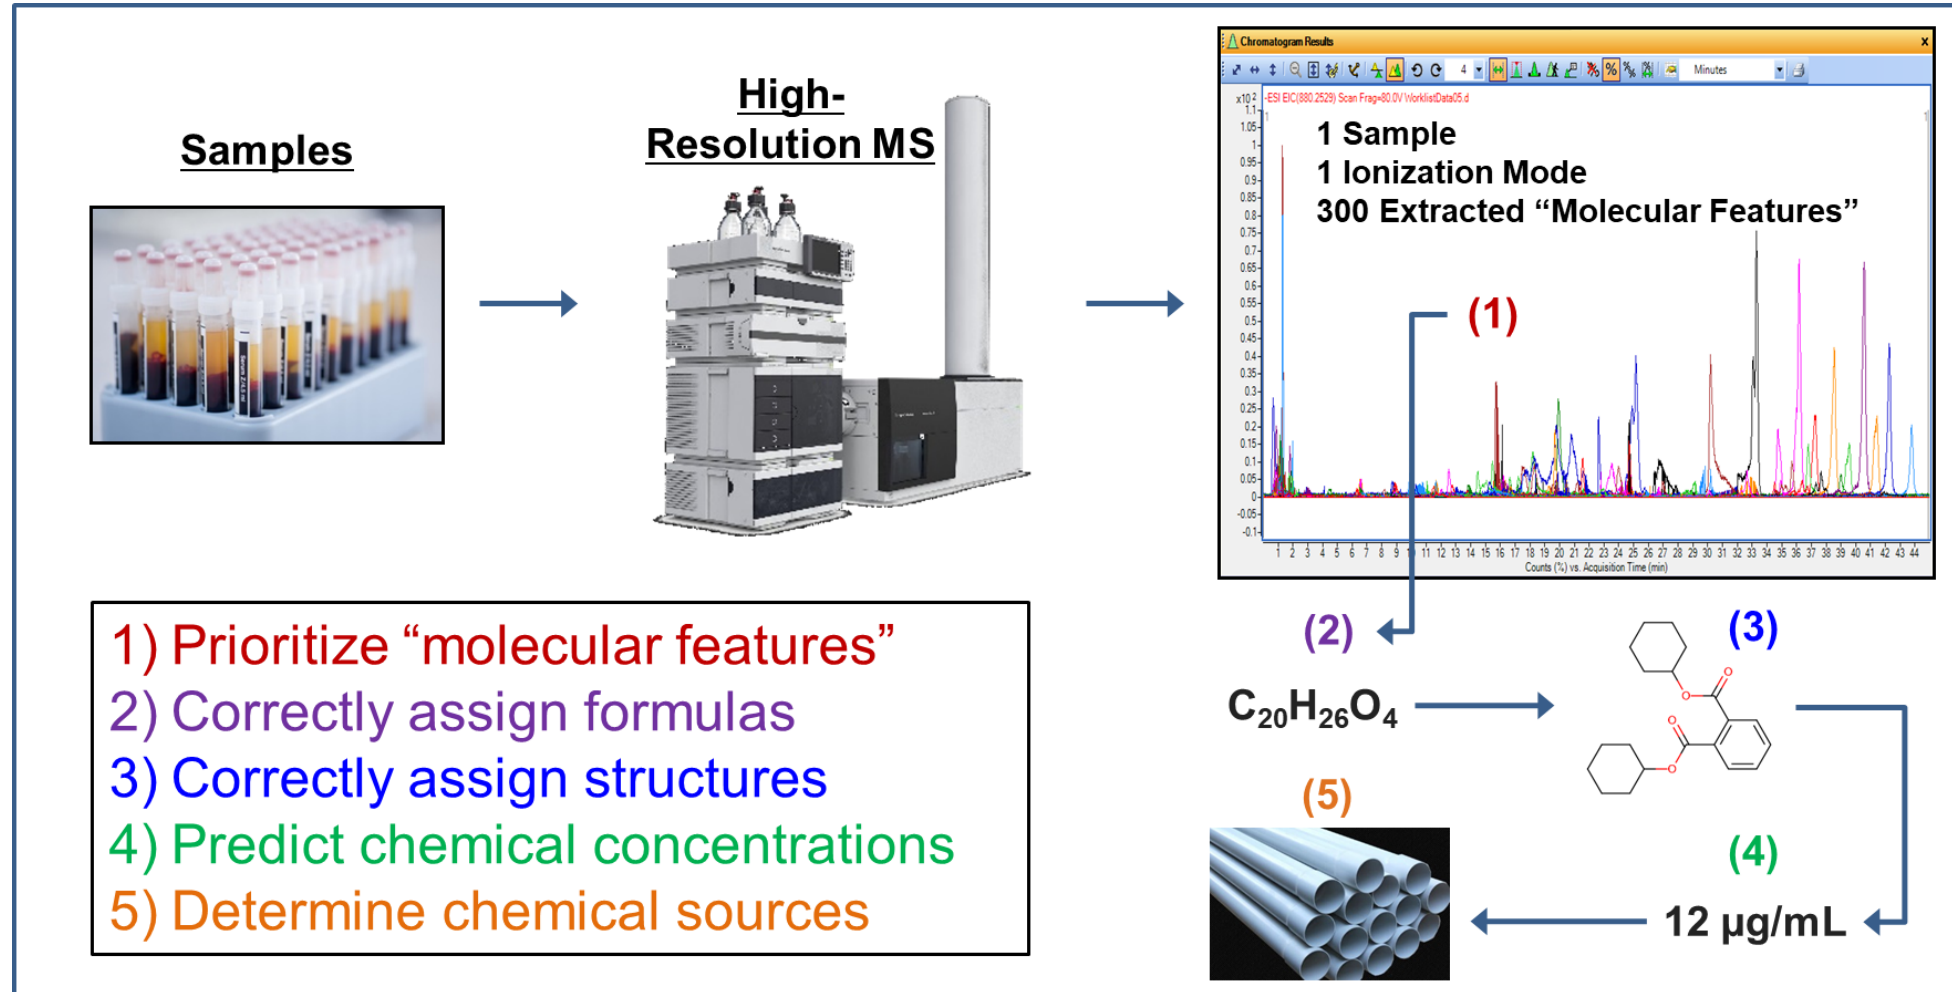

# What's So Great About NTA?

Rapidly screen  
for “knowns”

Discover  
“unknowns”

Uncover historical  
exposures

Generate source  
fingerprints...

# Example Uses and Requirements

| Study Level | Decision Context             |                            |                          | Example Uses of NTA Data   | Example Stakeholders   |
|-------------|------------------------------|----------------------------|--------------------------|--|--|
|             | <i>Sample Classification</i> | <i>Chemical Annotation</i> | <i>Semi-Quantitation</i> |  |  |

*“No single analytical technique is suitable for the analysis of all compounds, and successful nontargeted screening will require the development of multiplatform approaches, facilitated and validated through interlaboratory collaborations.”*

*“The novelty of nontarget analysis, particularly its current lack of implementation by regulatory agencies, has prevented the establishment of streamlined quality assurance and quality control (QA/QC) procedures.”*

# Science Questions for Research Community

- How variable are tools and results from lab to lab?
- Are some methods/workflows better than others?
- How does sample complexity affect performance?
- What chemical space does a given method cover?
- How sensitive are specific instruments/methods?

**Wikipedia**

**Paracetamol**, also known as **acetaminophen**, is a medication used to treat pain and fever. It is typically used for mild to moderate pain relief. Evidence is mixed for its use to relieve fever in children. It is often sold in combination with other medications, such as in many cold medications. Paracetamol is also used for severe pain, such as cancer pain and pain after surgery, in combination with opioid pain medication. It is typically used either by

## General Participants:

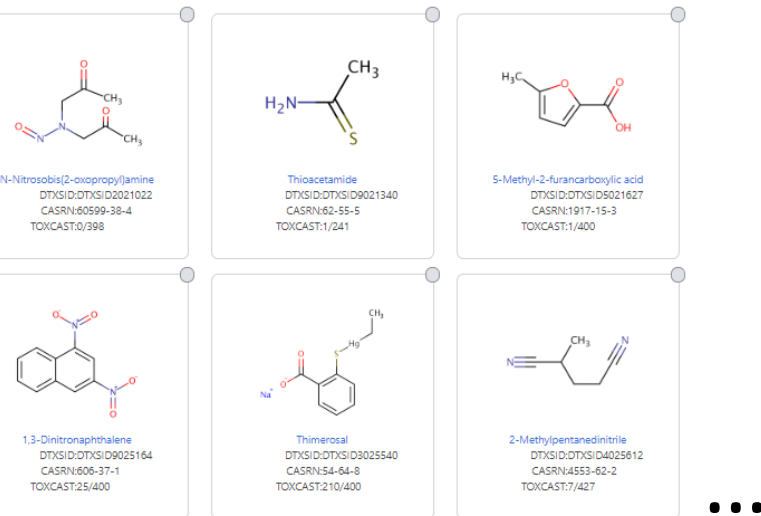

# Processing ENTACT Data Submissions

- Individual methods treated separately (if appropriate)
- One candidate mass/formula/compound per feature
- Confidence level revised as needed (with consensus)
- Matching to spiked substances by mass, formula & structure
- “**Observed**” if structure or formula (no spiked isomers) match
- “**Identified**” if structure match
- “**Reproducible**” if correctly ID’d >50% of the time
  - For compounds spiked >1 time and identified  $\geq 1$  time

# Method Comparison: “Observed” Compounds

7 Labs, 12 Methods

~5% Not Observed by Any Method

<1% Observed by All 12 Methods

# Method Comparison: Total Performance

**Metrics (all %):**

# Additional Results for Collaborators

- Simple performance summary file (n=1 per method):
  - # and % correct identifications per sample
- Individual results files (n=10 per method):
  - Mass match (yes/no), formula match (yes/no), compound match (yes/no)
  - Highest confidence level (as reported or after consensus revision)
- Composite results file (n=1 per method):
  - For each spiked substance (n=1,269)
    - # of spikes (1-10), # of isomer spikes (1-5)
    - # mass hits, # formula hits, # compound hits
    - Observed (yes/no/undetermined), Correct ID (yes/no), Reproducible (yes/no)

# Some Challenges (to date)

- Multiple chemical candidate submissions per feature
- Inconsistent & inaccurate use of scoring metrics
- Inconsistent & inaccurate chemical naming procedures
- Inconsistent and unclear feature filtering protocols
- Limited engagement regarding collaborator follow-up
- Determining false positives vs. unanticipated true positives
- Determining true negatives and dependent metrics
- Slow evaluation process vs. rapid method development processes

# Overall Summary

- Regulatory drivers necessitate NAMs for rapid risk characterization
- Measurement data are needed to inform and evaluate NAMs
- Targeted measurement methods can't keep pace with needs of NAMs
- NTA methods may meet needs, but require development and validation
- EPA/ORD is working to:
  - Develop tools to support NTA studies
  - Apply NTA methods to identify and prioritize chemicals based on anticipated risk
  - Evaluate NTA state-of-the-science via ENTACT

# Summary of ENTACT Findings

- NTA methods are suitable for many ToxCast chemicals
  - ~5% of ENTACT compounds not observed by any method
- Multiple methods required for broad characterization
  - No “one size fits all” method
  - <1% of ENTACT compounds observed using all methods
- Performance determined across 3 categories:
  - **Coverage** = Ability to Observe → (Range = 22% to 69%)
  - **Precision** = Ability to Identify those Observed → (Range = 7% to 99%)
  - **Reproducibility** = Ability to Consistently Identify → (Range = 7% to 97%)
- Concentration, media, and extraction techniques will affect performance
- Mixtures/data are highly valuable for NTA method development/evaluation
