

Implementing a Workflow for Exposure Screening of Drinking Water Contaminants of Concern

Kristin Isaacs

US EPA CSS-HERA Board of Scientific Counselors Chemical Safety Subcommittee Meeting

The views expressed in this presentation are those of the author and do not necessarily reflect the views or policies of the US EPA

February 2-5, 2021

Background

- The US Environmental Protection Agency's Center for Computational Toxicology and Exposure (CCTE) and the Minnesota Department of Health (MDH) are collaborating to use new chemical data generated from scientific approaches such as read-across, QSAR, high-throughput toxicology screening, and computational modeling of exposure and toxicokinetics to prioritize chemicals for further evaluation and inform risk assessment
- CCTE and MDH finalized a formal Cooperative Research and Development Agreement (CRADA) in 2019
 - CRADA has a goal of addressing up to five MDH chemical evaluation activities

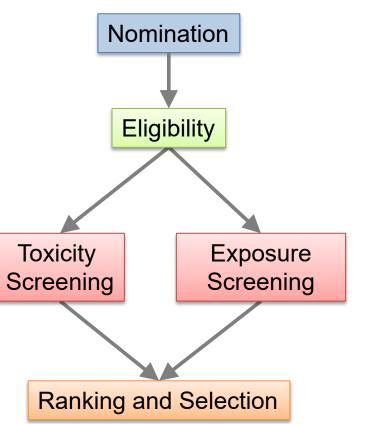

Problem: MDH CEC Initiative

- Through its Contaminants of Emerging Concern (CEC) initiative, the Minnesota Department of Health (MDH) collaborates with partners and the public to identify contaminants of interest in drinking water
- Substances that have been released to, found in, or have the potential to enter Minnesota waters, and:
 - Real or perceived health threat,
 - No current Minnesota human health-based guidance
 - New information that increases the level of concern

Problem: MDH CEC Initiative

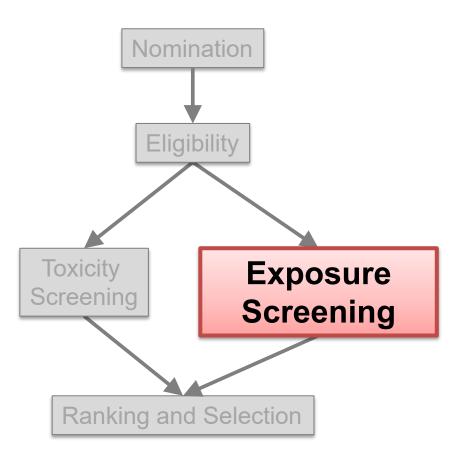

MDH CEC Process

- Through its Contaminants of Emerging Concern (CEC) initiative, the Minnesota Department of Health (MDH) collaborates with partners and the public to identify contaminants of interest in drinking water
- Substances that have been released to, found in, or have the potential to enter Minnesota waters, and:
 - Real or perceived health threat,
 - No current Minnesota human health-based guidance
 - New information that increases the level of concern
- Substances selected via a nomination process, followed by:
 - Screening-level evaluation and ranking of nominated chemicals based on exposure and toxicity potential
 - Screening informs selection of contaminants for an in-depth toxicological review and guidance development

Problem: CEC Exposure Screening

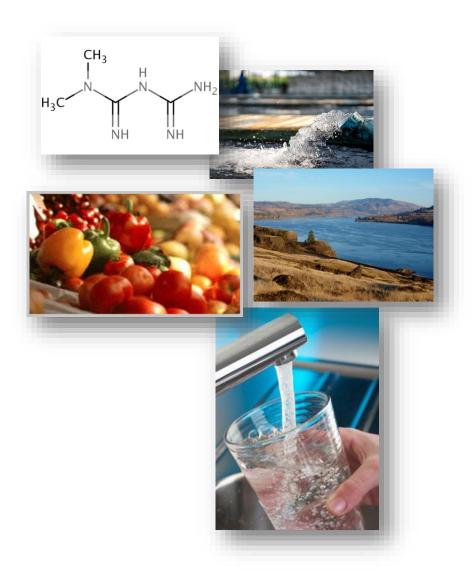

- **Exposure screening** was identified by MDH as a highpriority workflow for implementation under the CRADA
- Past approach: manual exposure screening by MDH staff
 - Data identification is time-consuming process (multiple days to a week for 1 chemical)
 - Disparate data sources
 - Synthesis can be challenging
 - Scoring is also manual: tedious/unreproducible
 - Many chemicals are data-poor based on traditional approaches (for example, existing regulatory exposure assessments, traditional monitoring data)

Approach

- Establish collaboration between MDH and CCTE accelerate the exposure screening process
- Develop a proof-of-concept automated workflow for scoring chemicals and reporting results according to MDH screening criteria
- Incorporate New Approach Methodologies (NAMs) for exposure from ORD's Exposure Forecasting (ExpoCast) project
- Apply workflow to two chemical lists
 - 87 chemicals previously manually evaluated by MDH (for assessment of workflow performance)
 - 171 proof-of-concept chemicals of interest to MDH and EPA

CEC Exposure Screening Criteria

- Uses components of the US EPA's Office Water Candidate Contaminant List (CCL) methodology and incorporates the recommendations from MDH Stakeholder Task Group
- Considers data and criteria associated with multiple domains, including
 - Chemical identity and use
 - Chemical properties
 - Chemical emissions and disposal
 - Chemical occurrence in environment, drinking water, and food
 - Human exposure potential
- Incorporates MN information where possible

Main Scoring Criteria

Persistence and Fate Release Potential Occurrence

Unadjusted Score

Scoring Adjustments (+/-)

Chemical Identity* Exposure Potential Detection Frequency (-) Score Adjustments = Final Score

+

CEC Exposure Screening Process

- Uses components of the US EPA's Office Water Candidate Contaminant List (CCL) methodology and incorporates the recommendations from MDH Stakeholder Task Group
- Considers data and criteria associated with multiple domains, including
 - Chemical identity and use
 - Chemical properties
 - Chemical emissions and disposal
 - Chemical occurrence in environment, drinking water, and food
 - Human exposure potential
- Incorporates MN information where possible
- Evaluates and scores chemicals using algorithm developed by MDH (primary unadjusted score + score adjustments= final score)

Current Opinion in Toxicology Available online 31 July 2019 In Press, Journal Pre-proof (?)

New Approach Methodologies for Exposure Science

John F. Wambaugh ¹ \cong ^{IZI}, Jane C. Bare ², Courtney C. Carignan ³, Kathie L. Dionisio ⁴, Robin E. Dodson ^{5, 6}, Olivier Jolliet ⁷, Xiaoyu Liu ⁸, David E. Meyer ², Seth R. Isaacs ⁴

- Chemical descriptors that provide information on chemicals in an exposure context (e.g., how chemicals are used)
- Machine-learning approaches that use these descriptors to fill gaps in existing data
- *High-throughput exposure models* that address various pathways
- *High-throughput measurements* that fill gaps in monitoring data
- High-throughput approaches that measure or predict chemical toxicokinetics
- New *evaluation frameworks* that integrate models and monitoring to provide consensus exposure predictions

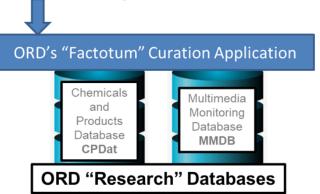

All these pieces together provide can accelerate highthroughput risk-based chemical prioritization

Data Curation

MN-specific documents and other source documents extracted and curated into ORD's research databases via the Factotum curation application.

QA, document provenance, audit tracking

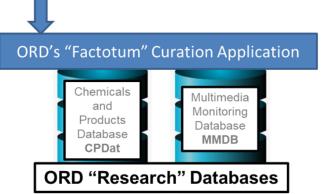

Data Curation

MN-specific documents and other source documents extracted and curated into ORD's research databases via the Factotum curation application.

QA, document provenance, audit tracking

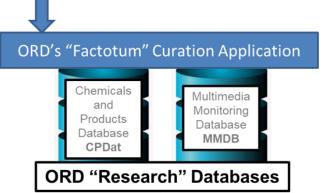

Other public data streams, e.g. USGS webservices or datasets not yet incorporated into formal ORD databases

Data Curation

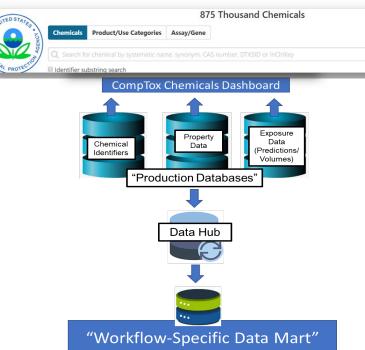

MN-specific documents and other source documents extracted and curated into ORD's research databases via the Factotum curation application.

QA, document provenance, audit tracking

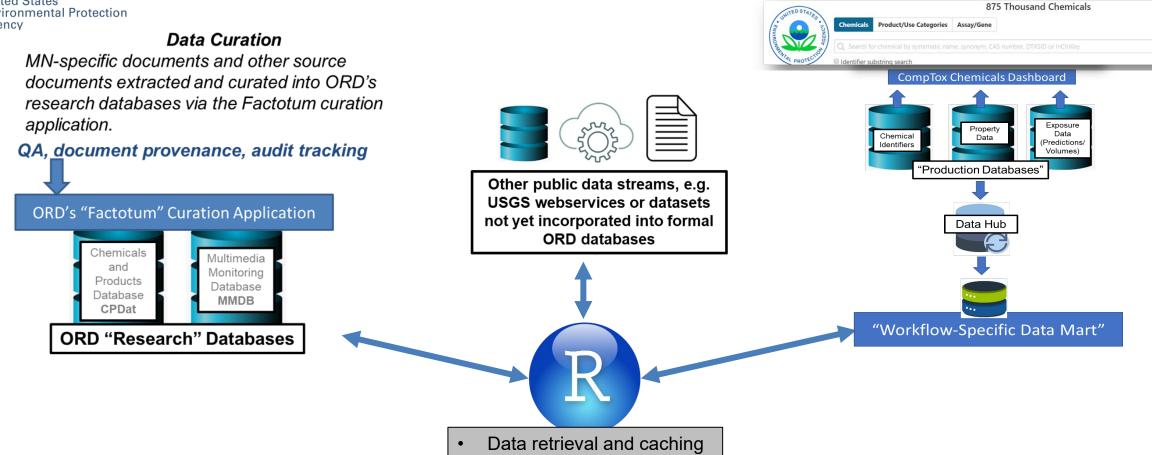

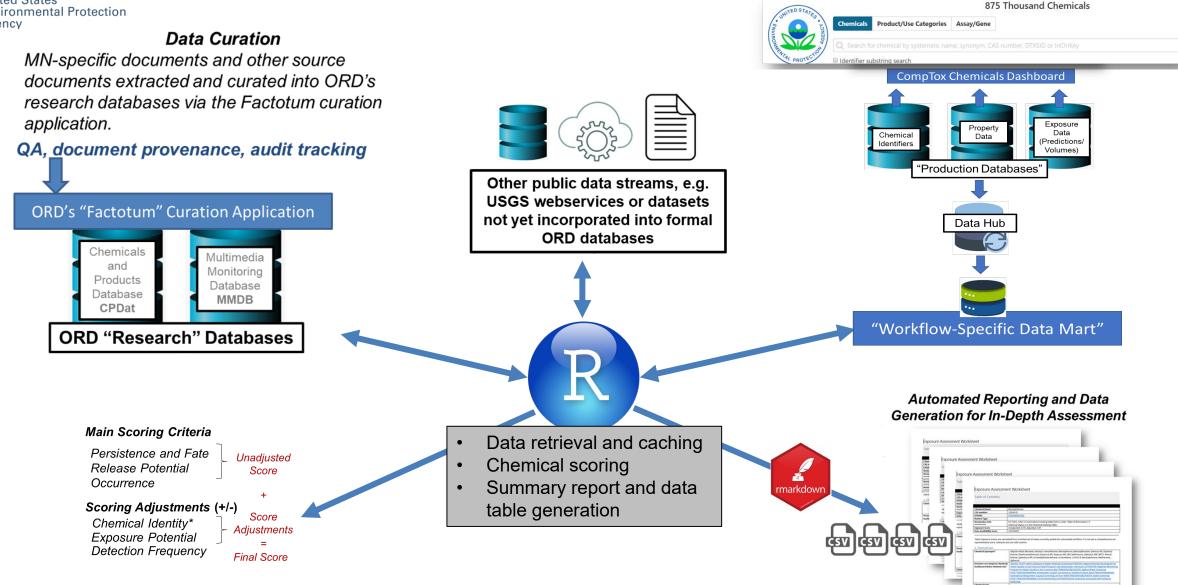

Other public data streams, e.g. USGS webservices or datasets not yet incorporated into formal ORD databases

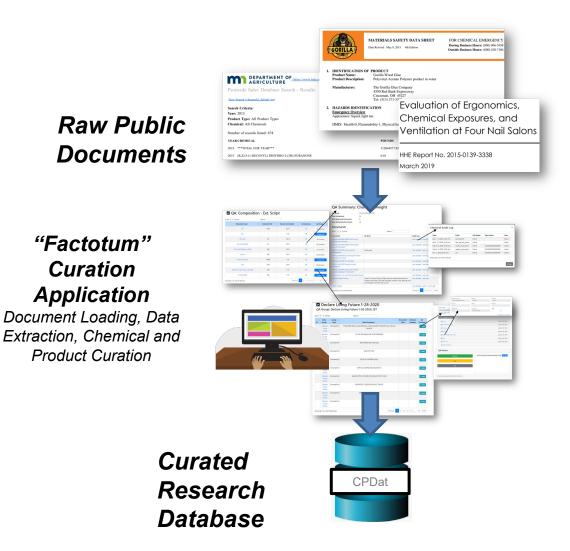

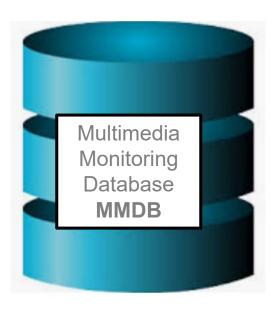

Curation of Chemical Use Descriptors with Factotum

- We are using informatics approaches to obtain and curate chemical use descriptor information
- Public data sources: reports, consumer product ingredient data, etc.
- Utilizing standard curation/QA procedures and tools
- Currently supports EPA's Chemical and Products Database
- Integrates with ORD's chemical curation workflows
- Allowed us to curate many MN-specific documents for use in the workflow

Multimedia Monitoring Database (MMDB)

- ORD research database of measurements from over 20 public data sources
 - Includes data from several EPA programs, California state monitoring programs, the FDA, the Comparative Toxicogenomics Database, the EU's Information Platform for Chemical Monitoring Data (IPCHEM), the National Health and Nutrition Examination Survey (NHANES), the USDA, the International Council for the Exploration of the Sea (ICES), and the International Council of Chemical Associations' Long-Range Research Initiative (ICCA-LRI)
 - Harmonized to **chemical identifier and media** (e.g., drinking water, surface water, human blood or urine, soil, food, and ecological species).
- Developed in collaboration with OPPT
- Contains over 250 million individual data records covering over 3200 unique chemicals
- Basis for future QSAR-like models for occurrence in different media
- Manuscript for submittal for peer-reviewed publication in internal EPA clearance

Data Source Summary

Environmental Protection	Chemical Identity and Use		
Agency	Chemical Identifiers and Synonyms		EPA-ORD's CompTox Chemicals Dashboard/Underlying Databases
	Uses		EPA-ORD's Chemicals and Products Database ¹ (CPDat)
	Uses		EPA's Chemical Data Reporting (CDR) Consumer, Commercial, Industrial uses
	National Production Volume		EPA-ORD's CompTox Chemicals Dashboard (Underlying data)
	Uses		EPA Safer Chemical Ingredients List
	Chemical Properties		
ncorporate	Measured Properties		EPA-ORD's CompTox Chemicals Dashboard/Underlying Databases
	Predicted Properties		EPA-ORD's CompTox Chemicals Dashboard (OPERA QSAR Models ⁴)
oosure	Predicted Wastewater Treatment Removal		EPA's Estimation Program Interface Suite (EPI-Suite)
M data	Transformation Products		EPA-ORD's CompTox Chemicals Dashboard/Underlying Databases
	Chemical Emissions and Disposal		
	Pesticide Releases		National Agricultural Statistic Service
	Chemical Releases		EPA's Toxics Release Inventory
	Down-the-Drain Releases		EPA's SHEDS-HT model
	Chemical Occurrence in Environment, Drinking Water,	, and	
	Food		
	Occurrence in Environmental Media, Including Drinking and Surface Water		EPA-ORD Multimedia Monitoring Database (MMDB)
	Occurrence in US Water		US Geological Survey (USGS) Water Quality Portal data, via its application programming interface (API)
	Occurrence in MN Water		Custom Database developed by USGS for MDH
	Occurrence in MN Water		MN-specific reports, curated into EPA's chemical databases
	Occurrence in Food		US Department of Agriculture (USDA) Pesticide Data Program
	Occurrence in Food		US Food and Drug Administration (FDA) Substances Added to Food Database
	Occurrence in Food		US Food and Drug Administration (FDA) Indirect Food Additives Database
	Human Exposure		
	Intake Exposures Inferred from Biomonitoring Data	EPA-OR	D's CompTox Chemicals Dashboard/Underlying Databases
	Biomonitoring Data	EPA-OR	D Multimedia Modeling Database (MMDB)
	Consumer Exposure Predictions	EPA-ORD's SHEDS-HT Model	
	General Population Exposures	EPA-ORD's Systematic Empirical Evaluation of Models (SEEM) Consensus Predictions	
	Presence on Biomonitoring Lists	Biomon	itoring California

US EPA CSS-HERA BOSC Meeting – February 2-5, 2021

Comparison of Automated Workflow with Manual Results

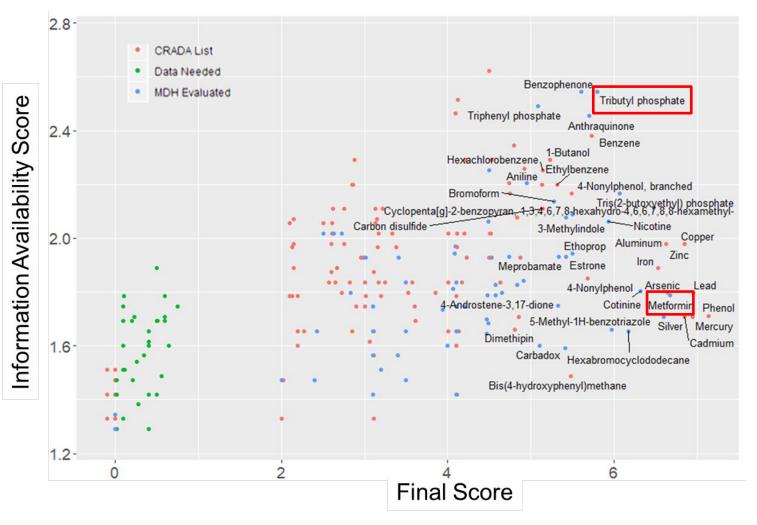

- The automated workflow was applied to the 258 chemicals (87 evaluated by MDH previously, 171 on the current proof-of-concept list)
- Also defined an "Information Availability Score"
- All data collection, scoring, and report/table writing were completed in approximately 18 hours

Results

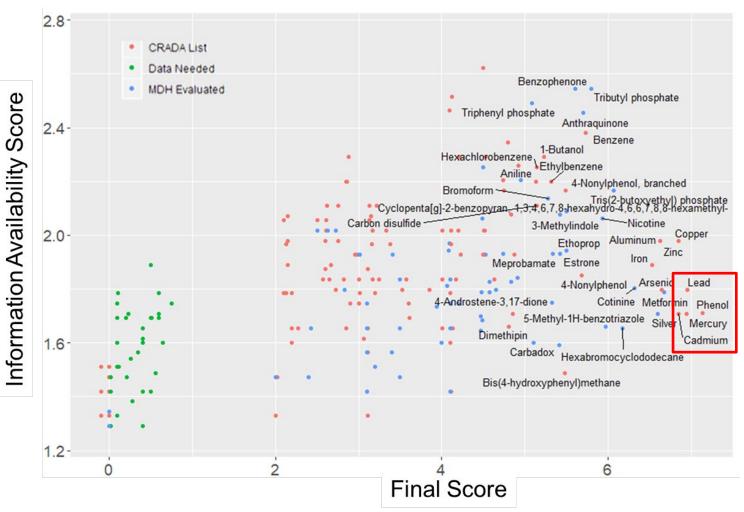

- The automated workflow was applied to the 258 chemicals (87 evaluated by MDH previously, 171 on the current proof-of-concept list)
- Also defined an "Information Availability Score"
- All data collection, scoring, and report/table writing were completed in approximately 18 hours
- Many of the chemicals with the highest scores (>5) have already been screened by MDH.

Results

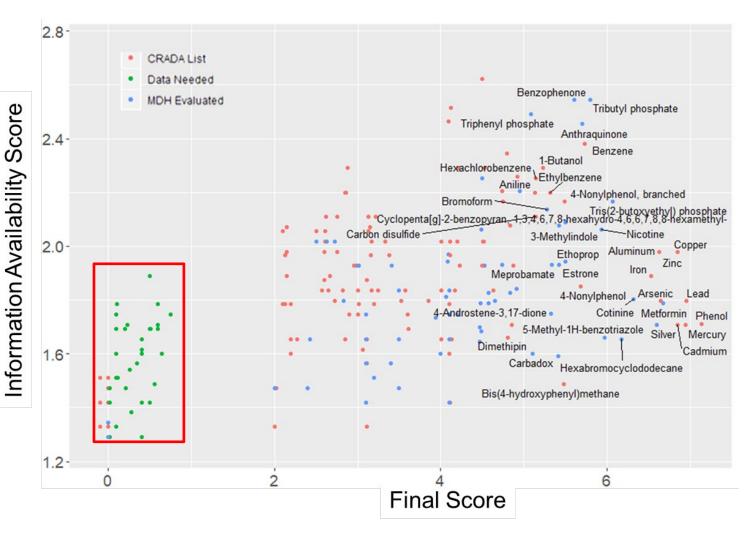

- The automated workflow was applied to the 258 chemicals (87 evaluated by MDH previously, 171 on the current proof-of-concept list)
- Also defined an "Information Availability Score"
- All data collection, scoring, and report/table writing were completed in approximately 18 hours
- Many of the chemicals with the highest scores (>5) have already been screened by MDH.
 - Identified several other chemicals that have not undergone explicit exposure screening process by MDH but have been identified as priority to evaluate via assessments outside the CEC initiative

Results

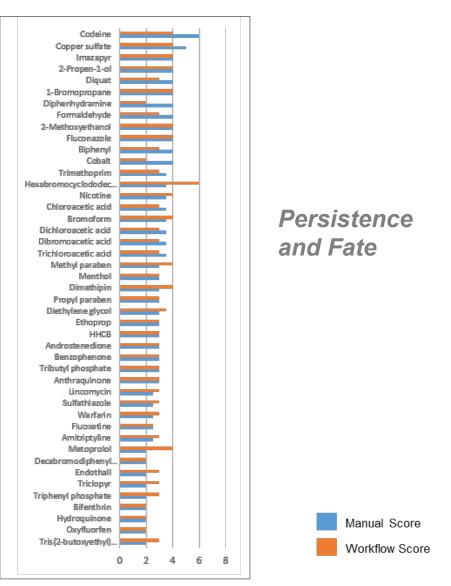

- The automated workflow was applied to the 258 chemicals (87 evaluated by MDH previously, 171 on the current proof-of-concept list)
- Also defined an "Information Availability Score"
- All data collection, scoring, and report/table writing were completed in approximately 18 hours
- Many of the chemicals with the highest scores (>5) have already been screened by MDH.
 - Identified several other chemicals that have not undergone explicit exposure screening process by MDH but have been identified as priority to evaluate via assessments outside the CEC initiative
- There were 82 chemicals that did not have enough data for main unadjusted scores to be calculated
 - 36 had positive exposure scoring adjustment (might be priority for additional data collection/curation)

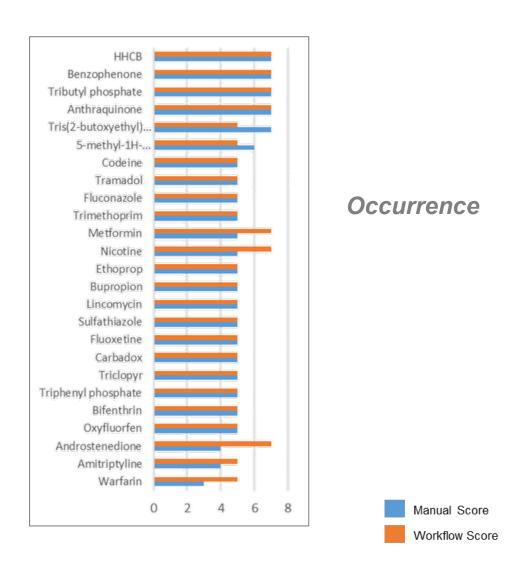

Results

Excellent agreement between scores in
 Persistence and Fate and Occurrence domains

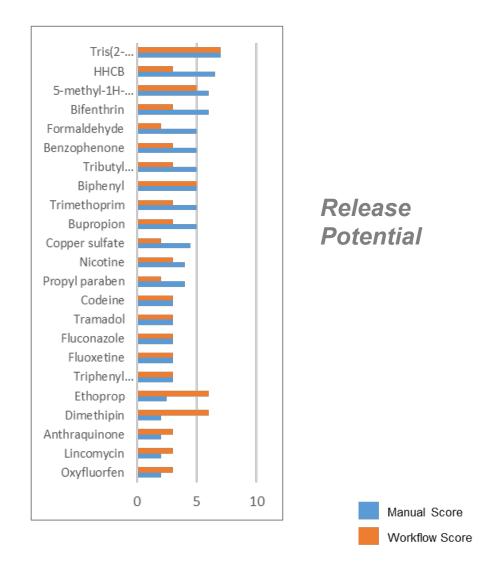

Excellent agreement between scores in
 Persistence and Fate and Occurrence domains

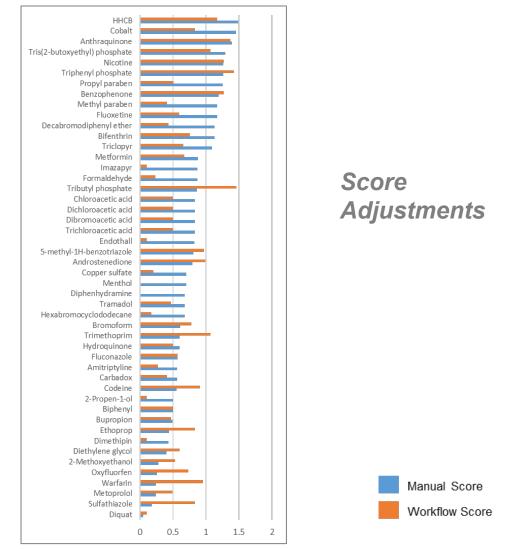

- Excellent agreement between scores in
 Persistence and Fate and Occurrence domains
- Somewhat poorer alignment in the **Release Potential** domain

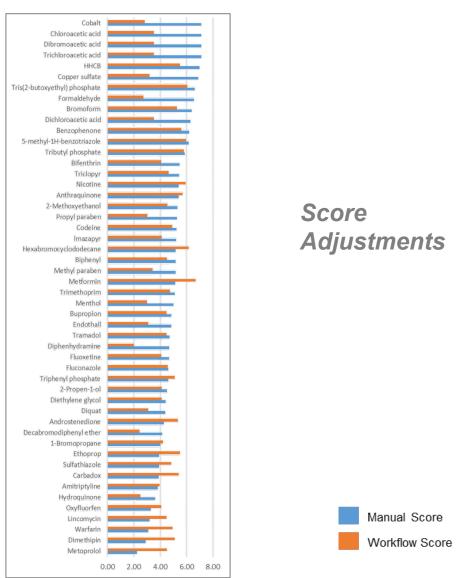

- Excellent agreement between scores in Persistence and Fate and Occurrence domains
- Somewhat poorer alignment in the Release
 Potential domain
- Poor agreement in score adjustments (i.e., detection frequency, human exposure potential)
 - Difference in estimates of detection frequencies in MMDB and MN sources
 - New exposure information from ExpoCast

- Excellent agreement between scores in
 Persistence and Fate and Occurrence domains
- Somewhat poorer alignment in the Release
 Potential domain
- Poor agreement in score adjustments (i.e., detection frequency, human exposure potential)
 - Difference in estimates of detection frequencies in MMDB and MN sources
 - New exposure information from ExpoCast
- Reflected in final scores

Next Steps

- Continue evaluations
 - Closer look at differences across the data domains
 - Are there priority data sources to be added?
- Incorporation of additional data streams into workflow
 - Integration into workflow of MN-specific water measurement database
 - Additional exposure NAMs, including machine-learning models for media occurrence built using the MMDB monitoring descriptors
- ORD toxicologists are working with MN to gather hazard data (including data from NAMs) for data-poor nominated CECs and those identified as having high exposure potential

- This workflow allows MDH health scientists to accelerate and expand exposure screening evaluations, freeing resources to complete the more complex aspects of exposure assessment
- Large libraries of chemicals relevant to MDH can be rapidly screened for *a priori* identification of new potential nominees (something that has never been feasible)
- The implemented workflow has formed a basis for exposure screening under another MDH regulatory program, the **Toxic Free Kids** initiative (implementation now underway, MDH concurrently developing screening algorithm in collaboration with ORD)
- ORD has had initial conversation with Office of Water to discuss potential use of a similar automated workflow approach for future CCL phases
