

# Exploring the Taxonomic Domain of Applicability of an Adverse Outcome Pathway Network Using Predictive Bioinformatic Approaches

Marissa Jensen

Integrated Biosciences Masters Student

University of Minnesota Duluth

The views expressed in this presentation are those of the author and do not necessarily reflect the views or policies of the US EPA.

- Collectively, we are concerned about chemical safety
- Challenge is that there are so many chemicals introduced
  - difficult to perform every test on every organism

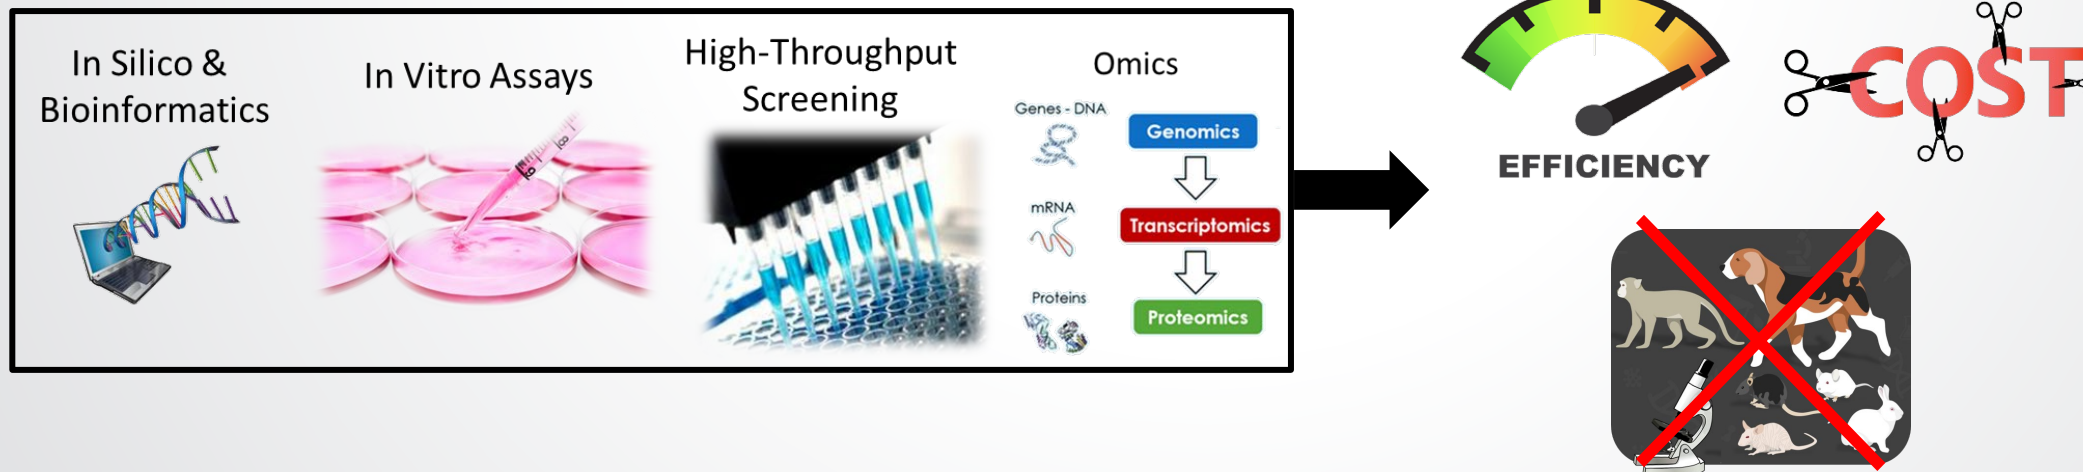

- Researchers are working to evaluate chemical safety more efficiently
- Recognition that approaches have to change to meet needs

# Movement from Whole Animal Testing to Pathway-Based Approaches

- Whole animal testing → New Approach Methods (NAMs)
  - Informatics, -omics, in vitro, in silico methods
- New tools developed because of the increase of new technology and availability of sequence data

## Adverse Outcome Pathway (AOP)

- AOP framework organizes existing knowledge regarding the linkage between a molecular initiating event (MIE) and an adverse outcome (AO) at a biological level of organization relevant to risk assessment
- KE events (KEs) and key event relationships (KERs) connect the MIE and AO
- Lays out the biology that is known and unknown to direct research efforts

# Sequence Alignment to Predict Across Species Susceptibility (SeqAPASS)

Sequence Alignment to Predict Across Species Susceptibility (SeqAPASS): A Web-Based Tool for Addressing the Challenges of Cross-Species Extrapolation of Chemical Toxicity

Carlie A. LaLone,<sup>\*,1</sup> Daniel L. Villeneuve,<sup>\*</sup> David Lyons,<sup>†</sup> Henry W. Helgen,<sup>‡</sup> Serina L. Robinson,<sup>§,2</sup> Joseph A. Swintek,<sup>¶</sup> Travis W. Saari,<sup>\*</sup> and Gerald T. Ankley<sup>\*</sup>

- Developed to understand target conservation across taxonomic groups to be able to predict chemical susceptibility
- Assesses protein sequence and structure similarity
- Need knowledge of a chemical-protein interaction in a species

<https://seqapass.epa.gov/seqapass/>

## Level I: Primary Amino Acid Sequence Alignments

Level I  
Analyses

Susceptibility  
Prediction

### Sequence Alignment to Predict Across Species Susceptibility

(SeqAPASS)

VERSION 4.0

# SeqAPASS: The Basics

## Level 2: Conserved Functional Domain Alignments

Literature Review  
- Identify domains of interest

Level 2  
Analyses

Susceptibility  
Prediction

## Level 3: Critical Amino Acid Residue Conservation

Literature Review  
- Identify key amino acid residues

Level 3  
Analyses

Are the amino acids a total match or partial match?

Final  
Susceptibility  
Prediction

# Hypothesis and Objectives

## Hypothesis

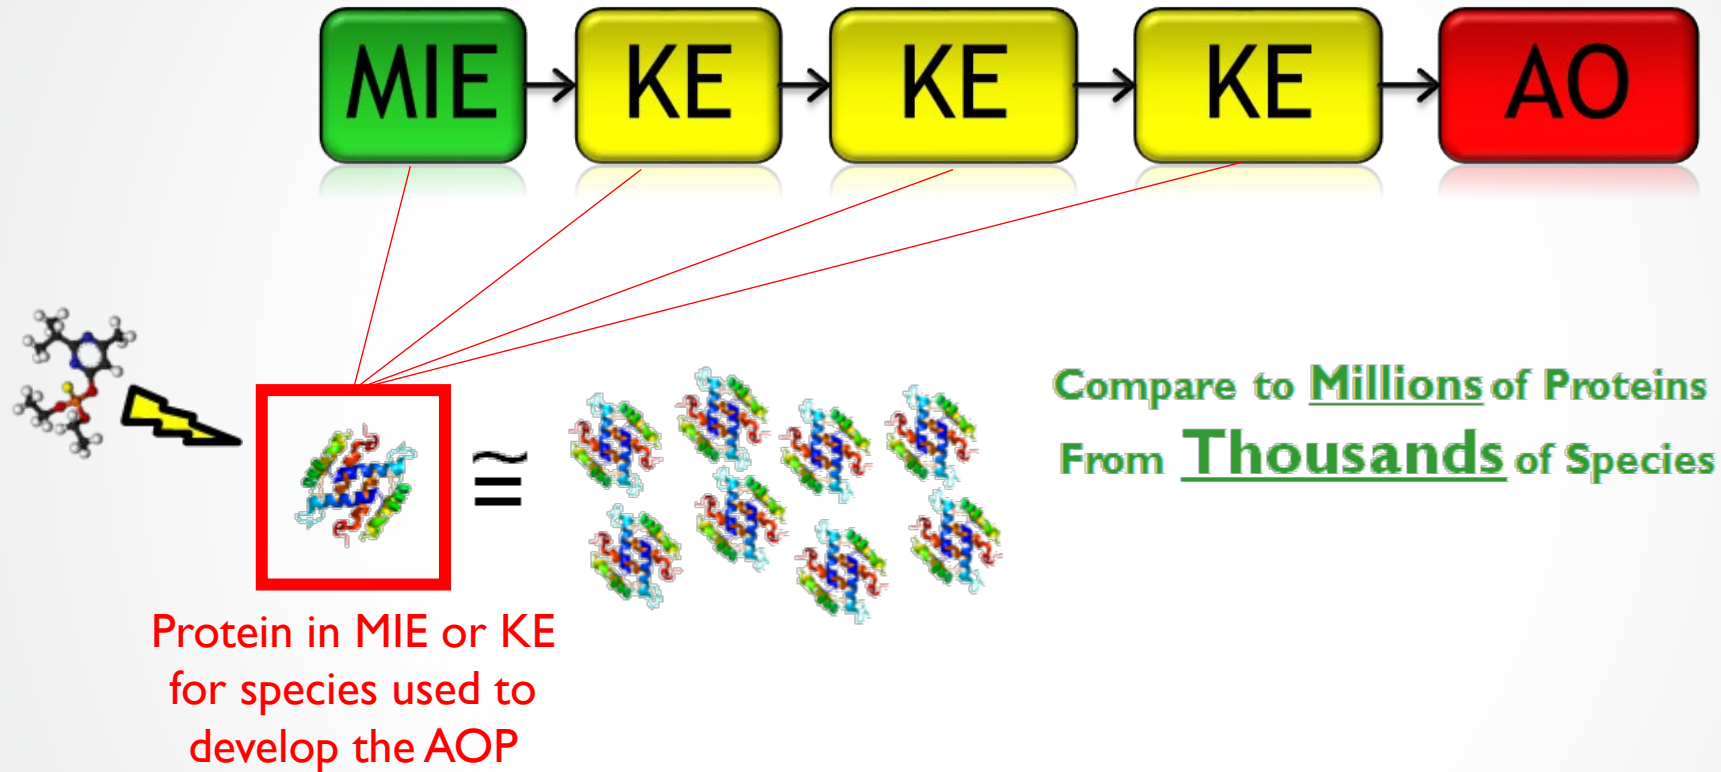

I hypothesize that SeqAPASS is a sufficient screening approach to understand pesticide susceptibility across species and can be used as an initial line of evidence for extrapolation of toxicity knowledge from one species to others

## Objectives

- Identify protein targets of AOP network involving honey bees (*Apis mellifera*) and neonicotinoids
- Find domain of applicability across pollinators, specifically *Apis* and non-*Apis* bees
- Evaluate cross-species effects of neonicotinoid pesticides for chemical safety evaluation

# Evaluation of Protein Conservation Across Species

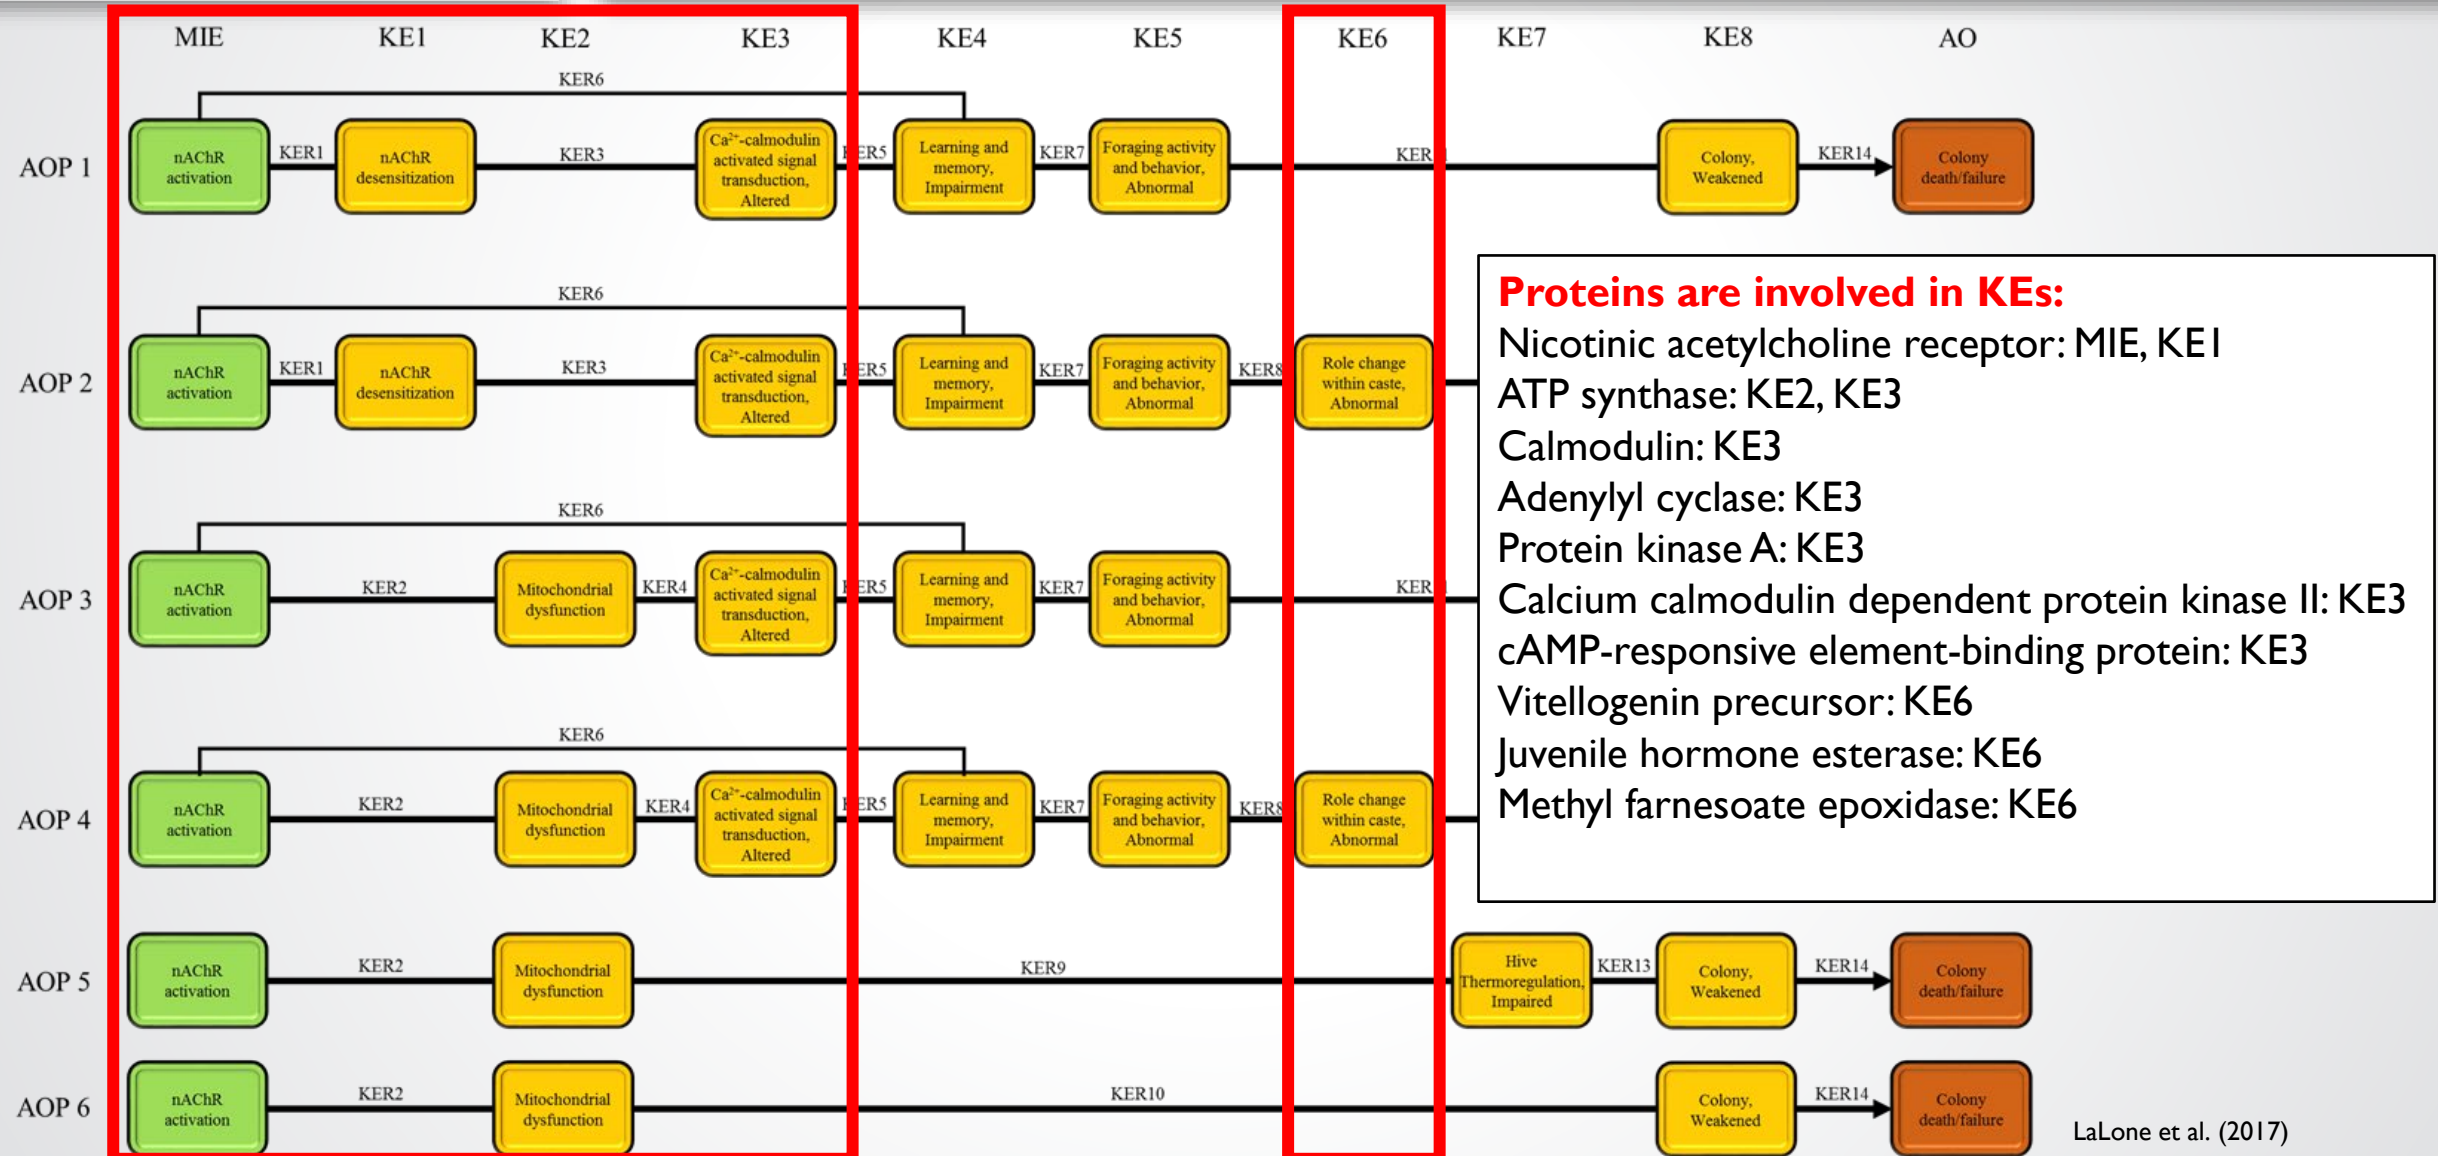

Conservation of MIE or KE across species = Extrapolate MIE or KE across species/taxa

Extrapolating biological pathway knowledge across species

# AOP Descriptions: Proteins Are Involved in KEs

# Defining the Taxonomic Domain of Applicability

?

How broadly can we extrapolate this AOP across species?

- Evolution
- Structure and Function

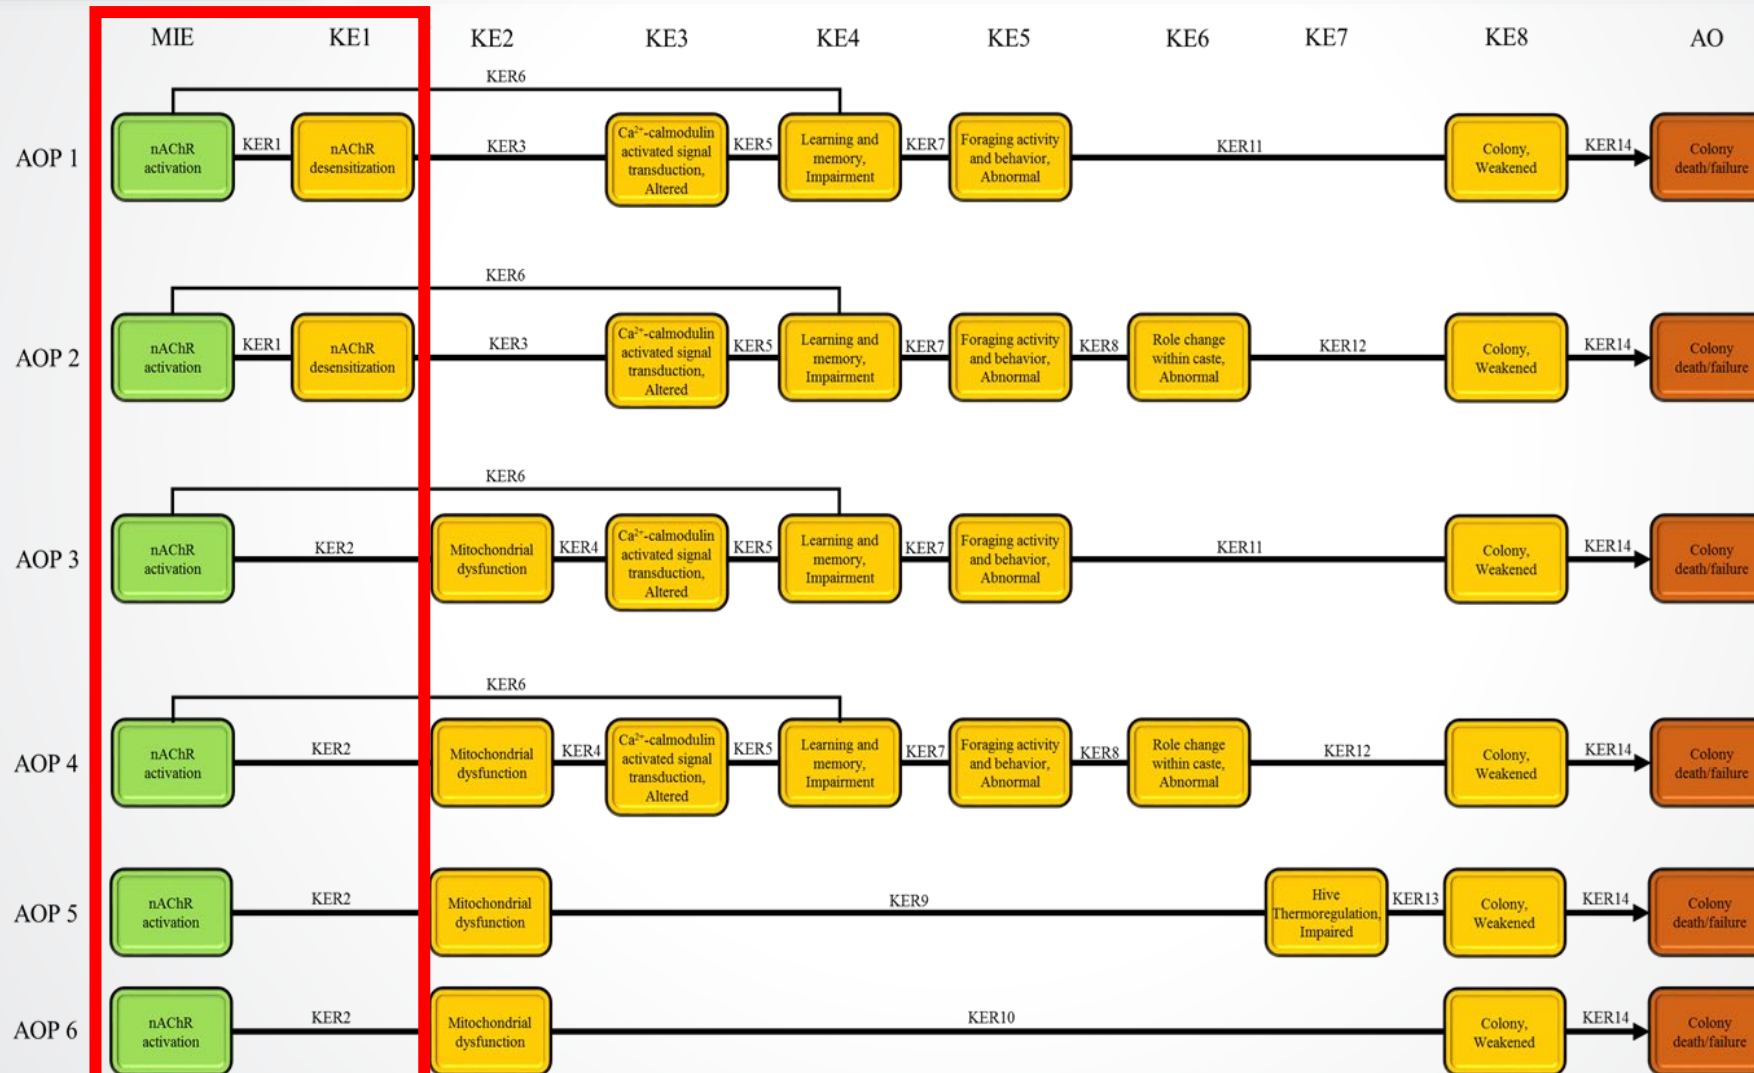

Protein in MIE or KE  
for species used to  
develop the AOP

Compare to Millions of Proteins  
From Thousands of Species

# Molecular Initiating Event (MIE) and Key Event I (KEI)

Molecular  
Initiating  
Event

Nicotinic acetylcholine receptor (nAChR)

Taken from: Jones and Sattelle, 2010

Adverse  
Outcome

# Level I SeqAPASS Results: MIE and KEI

## Nicotinic Acetylcholine Receptor $\alpha$ I Subunit

### Primary Amino Acid Sequence Alignment

## Level 2 SeqAPASS Results: MIE and KEI

### Conserved Functional Domain Alignment

### Nicotinic Acetylcholine Receptor $\alpha$ I Subunit Neurotransmitter-gated ion-channel ligand binding domain

# Level 3 SeqAPASS Results: MIE and KEI

## KE2 and KE3

Biological Plausibility: Strong

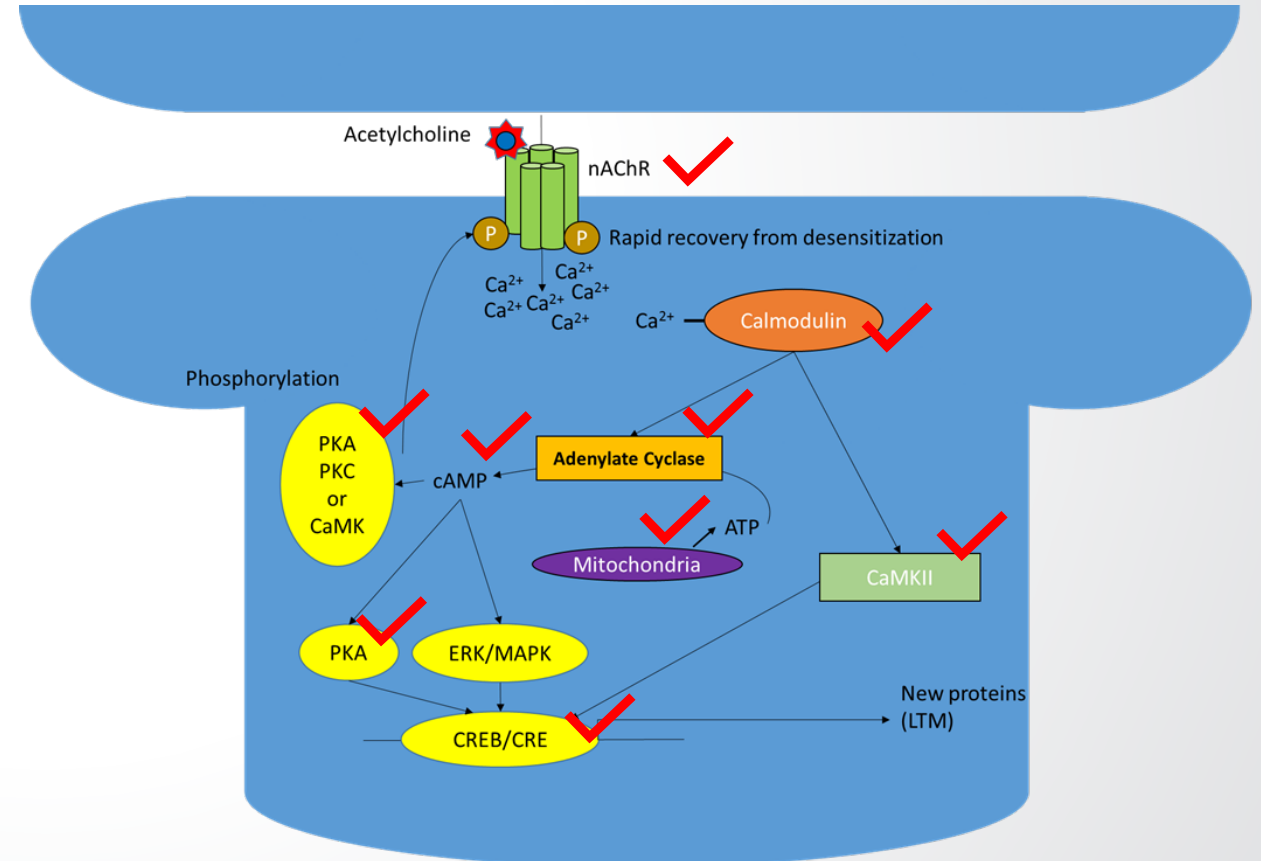

# SeqAPASS Results: KE2 and KE3

## KE2 and KE3 Conserved Among:

<i>Apis</i>	<i>Habropoda</i>
<i>Eufriesea</i>	<i>Diachasma</i>
<i>Megachile</i>	<i>Fopius</i>
<i>Nomia</i>	<i>Orussus</i>
<i>Bombus</i>	<i>Belonocnema</i>
<i>Osmia</i>	<i>Nasonia</i>
<i>Megalopta</i>	<i>Microplitis</i>
<i>Ceratina</i>	<i>Trichogramma</i>
<i>Polistes</i>	<i>Ceratosolen</i>
<i>Dufourea</i>	<i>Copidosoma</i>

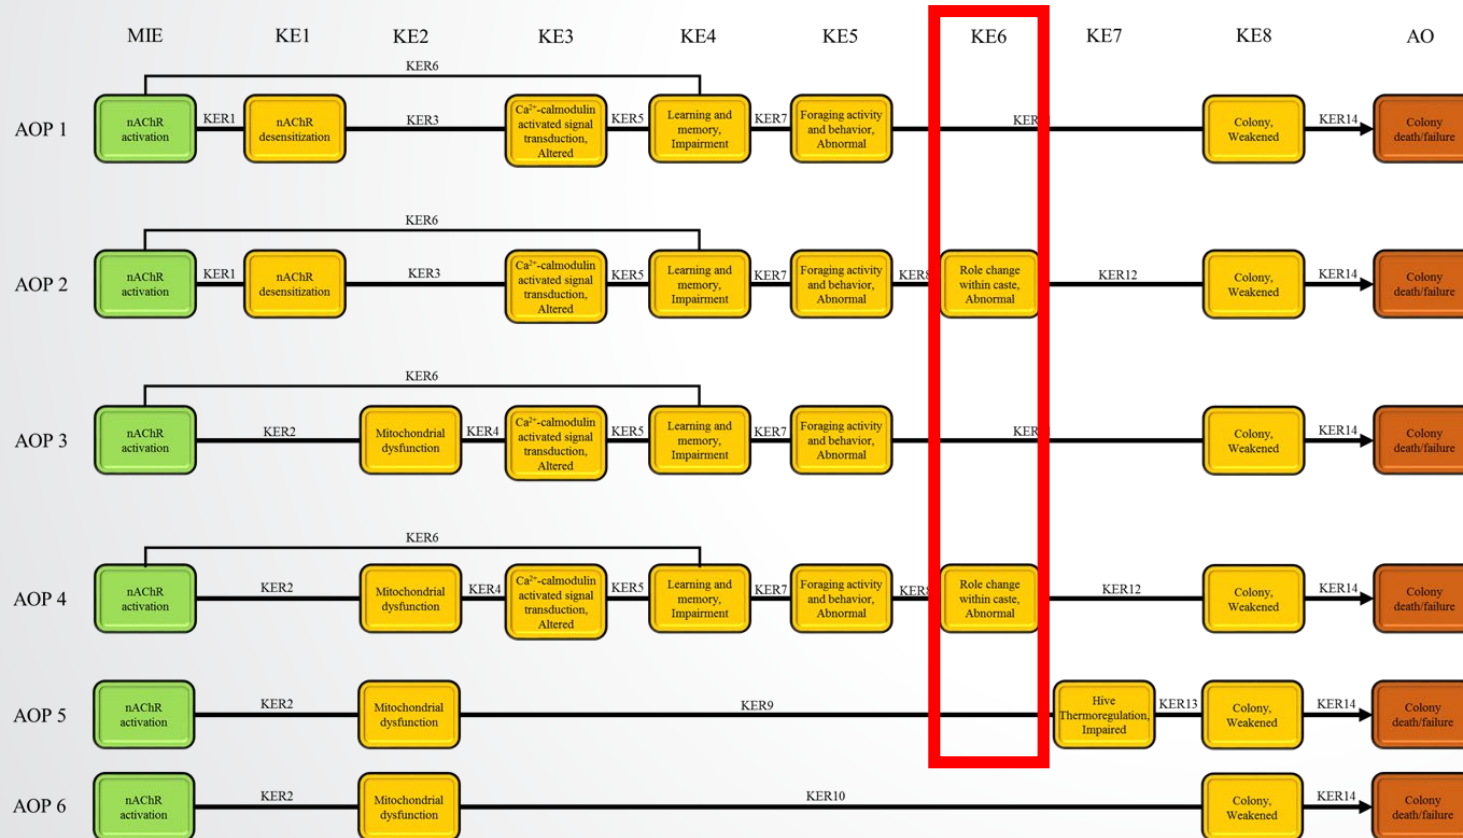

## Next Steps/Future Work

- Identifying conservation of proteins in late key events of AOP
- Other considerations to further define taxonomic domain of applicability

Nicotinic acetylcholine receptor: MIE, KE1

ATP synthase: KE2, KE3

Calmodulin: KE3

Adenylyl cyclase: KE3

Protein kinase A: KE3

Calcium calmodulin dependent protein kinase II: KE3

cAMP-responsive element-binding protein: KE3

Vitellogenin precursor: KE6

Juvenile hormone esterase: KE6

Methyl farnesoate epoxidase: KE6

- Identifying conservation of proteins in late key events of AOP
  - Other considerations to further define taxonomic domain of applicability
- Can we add evidence to the SeqAPASS predictions?
  - Toolbox: site-directed mutagenesis, in vitro, whole organism studies, molecular modeling/docking
- Use other AOPs!

Species used to develop AOP
