

# Overview of the CompTox Chemicals Dashboard and ToxCast/Tox21 Screening Program: Tools for Users

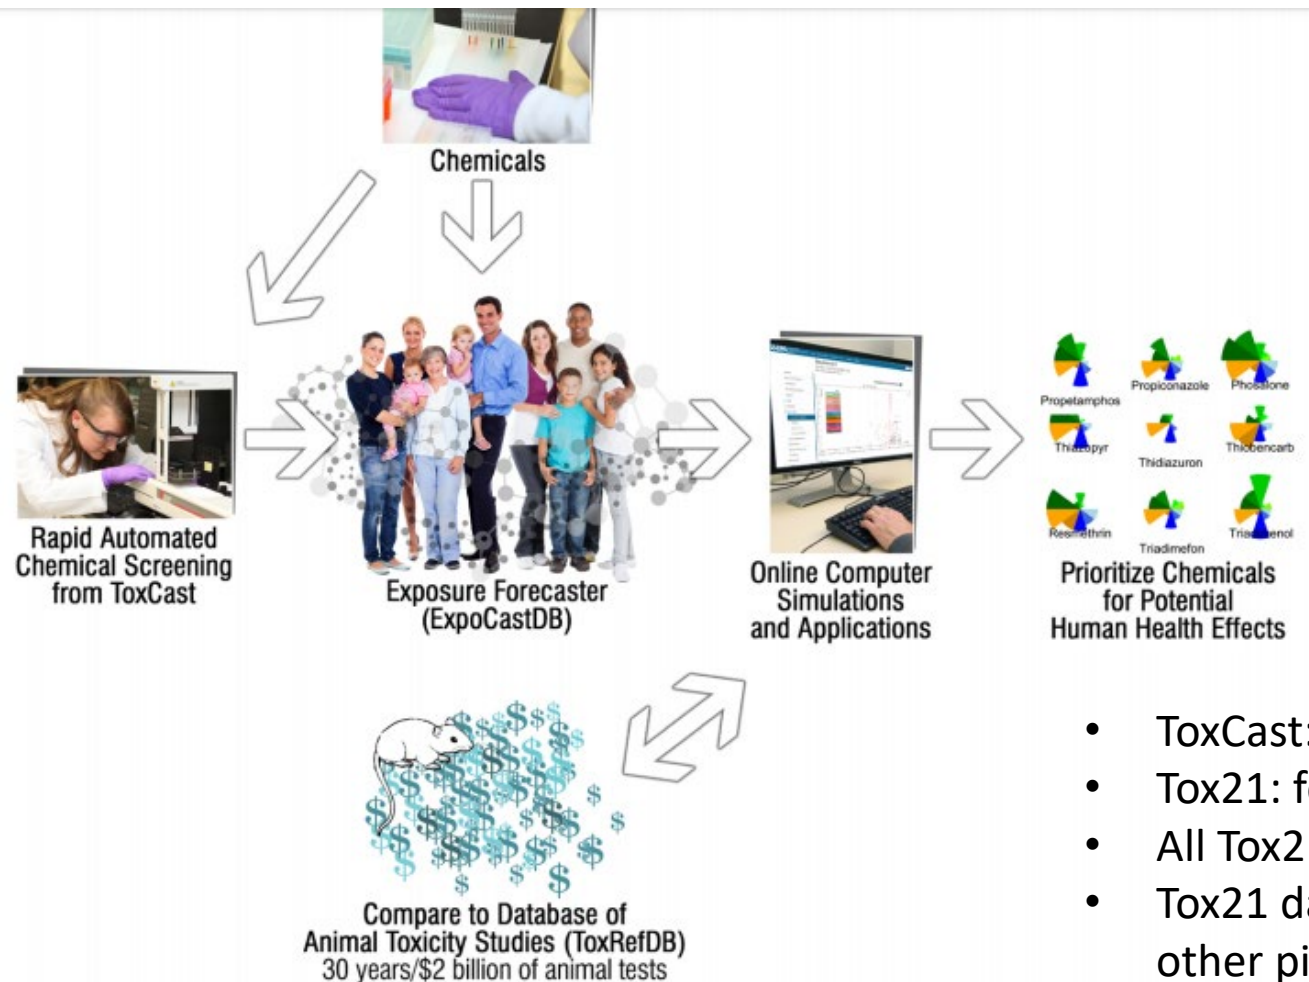

Katie Paul Friedman, PhD  
[paul-friedman.katie@epa.gov](mailto:paul-friedman.katie@epa.gov)

*Center for Computational Toxicology and Exposure, US-EPA, RTP, NC*

*The views expressed in this presentation are those of the authors and do not necessarily reflect the views or policies of the  
U.S. EPA*

ToxCast and Tox21 have generated a lot of publicly available bioactivity data for hazard screening and prediction.

## EPA's ToxCast program at a glance

Tox21 robot

- ToxCast: more assays, fewer chemicals, EPA-driven
- Tox21: fewer assays, mostly 1536, driven by consortium
- All Tox21 data are analyzed by multiple partners
- Tox21 data is available analyzed in the ToxCast Data Pipeline and other pipelines as well

# ToxCast covers a lot of biology but not all; and, ToxCast is growing over time.

*Invitrodb version 3.3 (released August 2020) contained 17 different assay sources, covering (at least) 491 unique gene-related targets with 1600 unique assay endpoints. Varying amounts of data are available for 9949 unique substances.*

Assay source	Long name	Truncated assay source description	Some rough notes on the biology covered
ACEA	ACEA Biosciences	real-time, label-free, cell growth assay system based on a microelectronic impedance readout	Endocrine (ER-induced proliferation)
APR	Apredica	CellCiphr High Content Imaging system	Hepatic cells (HepG2)
ATG	Attagene	multiplexed pathway profiling platform	Nuclear receptor and stress response profile
BSK	Bioseek	BioMAP system providing uniquely informative biological activity profiles in complex human primary co-culture systems	Immune/inflammation responses
NVS	Novascreen	large diverse suite of cell-free binding and biochemical assays.	Receptor binding; transporter protein binding; ion channels; enzyme inhibition; many targets
OT	Odyssey Thera	novel protein:protein interaction assays using protein-fragment complementation technology	Endocrine (ER and AR)
TOX21	Tox21/NCGC	Tox21 is an interagency agreement between the NIH, NTP, FDA and EPA. NIH Chemical Genomics Center (NCGC) is the primary screening facility running ultra high-throughput screening assays across a large interagency-developed chemical library	Many – with many nuclear receptors
CEETOX	Ceetox/OpAns	HT-H295R assay	Endocrine (steroidogenesis)
CLD	CellzDirect	Formerly CellzDirect, this Contract Research Organization (CRO) is now part of the Invitrogen brand of Thermo Fisher providing cell-based in vitro assay screening services using primary hepatocytes.	Liver (Phase I/Phase II/ Phase III expression)
NHEERL_PADILLA	NHEERL Padilla Lab	The Padilla laboratory at the EPA National Health and Environmental Effects Research Laboratory focuses on the development and screening of zebrafish assays.	Zebrafish terata
NCCT	NCCT Simmons Lab	The Simmons Lab at the EPA National Center for Computational Toxicology focuses on developing and implementing in vitro methods to identify potential environmental toxicants.	Endocrine (thyroid - thyroperoxidase inhibition)
TANGUAY	Tanguay Lab	The Tanguay Lab, based at the Oregon State University Sinnhuber Aquatic Research Laboratory, uses zebrafish as a systems toxicology model.	Zebrafish terata/phenotypes
NHEERL_NIS	NHEERL Stoker & Laws	The Stoker and Laws laboratories at the EPA National Health and Environmental Effects Research Laboratory work on the development and implementation of high-throughput assays, particularly related to the sodium-iodide cotransporter (NIS).	Endocrine (thyroid - NIS inhibition)
UPITT	University of Pittsburgh	The Johnston Lab at the University of Pittsburgh ran androgen receptor nuclear translocation assays under a Material Transfer Agreement (MTA) for the ToxCast Phase 1, Phase 2, and E1K chemicals.	Endocrine (AR related)

# With each release, more assay endpoints and more chemical x endpoint data are released

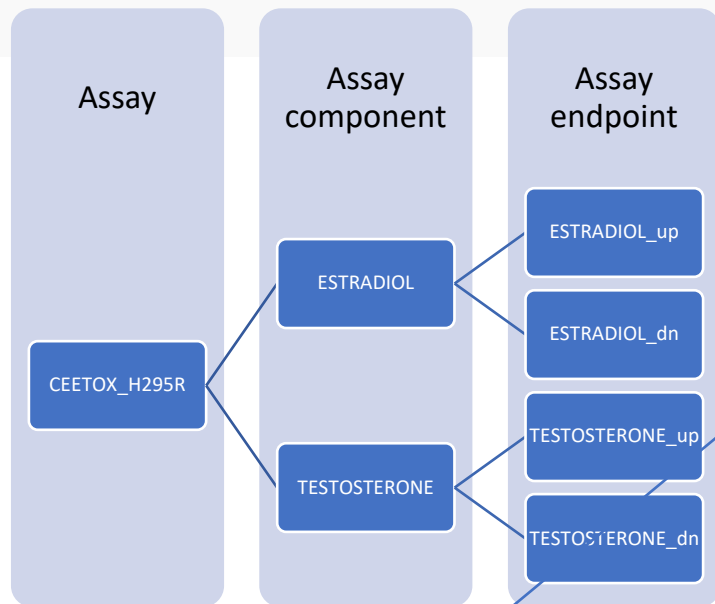

*Invitrodb version 3.3 (released August 2020) contained 17 different assay sources, covering (at least) 491 unique gene-related targets with 1600 unique assay endpoints. Varying amounts of data are available for 9949 unique substances.*

*These assay endpoints were notable additions in invitrodb version 3.3.*

Assay source	Long name	Truncated assay source description	Some rough notes on the biology covered
NCCT_MITO	NCCT (now Center for Computational Toxicology and Exposure) Mitochondrial toxicity	Respirometric assay that measure mitochondrial function in HepG2 cells	Multiple assay endpoints to evaluate mitochondrial function <a href="https://doi.org/10.1093/toxsci/kfaa059">https://doi.org/10.1093/toxsci/kfaa059</a> .
NHEERL_MED	NHEERL Mid-Continent Ecology Division	The EPA Mid-Continent Ecology Division of the National Health and Environmental Effects Research Laboratory screened the ToxCast Phase 1 chemical library for hDIO1 (deiodinase 1) inhibition as part of an ecotoxicology effort.	Endocrine (thyroid – hDIO1,2,3 inhibition) <a href="https://doi.org/10.1093/toxsci/kfy302">https://doi.org/10.1093/toxsci/kfy302</a>
STM	Stemina	Stem cell-based metabolomic indicator of developmental toxicity for screening.	Developmental toxicity screening – multiple assay endpoints <a href="https://doi.org/10.1093/toxsci/kfaa014">https://doi.org/10.1093/toxsci/kfaa014</a>
LTEA	Life Tech Expression Analysis	Gene expression measured in HepaRG cells following 48 hr exposure	Liver toxicity model via transcription factor regulated-metabolism and markers of oxidative/cell stress; multiple assay endpoints

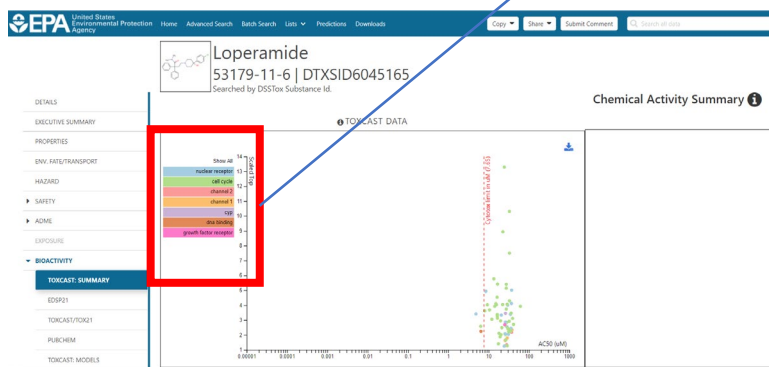

# Learning more about the assay endpoints and biology

## Example assay annotation hierarchy

- Many assay endpoints are mapped to a gene, if applicable
- Assay endpoints now cover 1398 unique gene targets in invitrodb version 3.3, in addition to other processes
- Intended target family is one way to understand biological target (incomplete list here):

- |                          |                                     |                         |
|--------------------------|-------------------------------------|-------------------------|
| • Apolipoprotein         | • Filaments                         | • Methyltransferase     |

# What can be done with ToxCast data?

## Answering biological questions

- *(for example)* Does this substance have endocrine or liver-mediated bioactivity?
- Is there support for one or more adverse outcome pathways based on these data, or does the substance appear “non-selective?”

## Answering risk-related questions

- Can a protective bioactivity-based point-of-departure be calculated?
- What is the relative priority of this substance for additional evaluation?

# Using ToxCast Data in Weight of Evidence or Screening Level Assessment

- Vignette 1: Weight of evidence example
- Vignette 2: Risk-based approach that incorporates bioactivity and exposure, making the best use of new approach methodologies, for endocrine bioactivity.

*This presentation will demonstrate where to find these information and suggest an approach for utilizing them in screening level risk evaluation.*

# Vignette one: bioactivity for weight-of-evidence/biological questions

Is mystery compound A toxic to liver and/or mitochondria?

# Mystery compound A: in domain of current screening?

Analytical chemistry:  
was the chemical  
present and in the  
DOA for current  
ToxCast?

Summary							
Property	Experimental average	Predicted average	Experimental median	Predicted median	Experimental range	Predicted range	Unit
LogKow: Octanol-Water	-	4.94		4.67	-	4.30 to 6.11	
Melting Point	185 (2)	215	185	184	184 to 185	150 to 313	°C
Boiling Point	-	589		657	-	397 to 714	°C
Water Solubility	-	5.40e-6		2.72e-6	-	8.75e-8 to 1.34e-5	mol/L
Density	-	1.27		1.27	-	1.27	g/cm^3
Flash Point	-	330		330	-	309 to 351	°C
Vapor Pressure	-	7.20e-10		3.83e-11	-	7.24e-18 to 2.12e-9	mmHg
Surface Tension	-	51.0			-	51.0	dyn/cm
Index of Refraction	-	1.61			-	1.61	-
Molar Refractivity	-	120			-	120	cm^3
Polarizability	-	47.8			-	47.8	Å^3
Molar Volume	-	349			-	349	cm^3
LogKoa: Octanol-Air	-	9.68			-	9.68	-
Henry's Law	-	5.64e-9			-	5.64e-9	atm-m3/mole

*MW = 441.54 g/mol – likely  
good oral availability*

## Summary

*Probably able to cross cell membrane without active transport*

*Not volatile*

# Mystery compound A seems to fit into the domain of screening based on chemistry

Analytical chemistry:  
was the chemical  
present and in the  
DOA for current  
ToxCast?

Models available?

Selective or non-selective?

Consider some of the information that might inform about liver toxicity:

- Mechanistic information on mitochondrial toxicity, oxidative stress, nuclear receptor transcription factor activity, markers of injury in liver-specific models, cell stress and cytotoxicity (inexhaustive listing here):

Biological process	Assay technologies	Details
Mitochondrial toxicity	TOX21_MMP	Mitochondrial membrane permeability (HepG2)
	NCCT_MITO	Multiple assay endpoints that measure oxygen consumption and respiration via Seahorse; can distinguish mechanism (HepG2)
	Apredica MitoMembPot	High content imaging, mitochondrial membrane permeability (HepG2)
	Apredica MitoMass	High content imaging, mitochondrial mass (HepG2)
Nuclear receptors and oxidative stress	ATG	Transcription factor activity, including nuclear receptor and cell stress panel (CIS by endogenous expression and TRANS by GAL4-NR receptor modules); HG19 subclone of HepG2 cells (for elevated metabolism)
	LTEA	mRNA expression in HepaRG for nuclear-receptor regulated metabolism/oxidative stress
	CLD	mRNA expression in sandwich-cultured primary human hepatocytes for Phase I-II metabolism and transport
	Tox21 NR assays	LUC and BLA nuclear receptor reporter assays
	NVS NR and transporter assays	Cell-free binding
	Odyssey Thera	Receptor complexes and stabilization of coactivator interaction
Cell stress and cytotoxicity	Viability and cell stress assays across platforms	88+ assays

# Looking for consistency in MOA and concentration ranges (this is just a subset of assay technologies for demonstration)

Mitochondria:  
*Consistency in MOA*  
Concentration ranges by  
technology; the NCCT  
Seahorse technology  
suggests 1-10 uM, similar to  
Tox21 MMP assay

Liver:  
*Clearly CYPs, Phase II  
transferases, and nuclear  
receptor interactions  
occurring*  
May occur at concentrations  
greater than mitochondria  
or cell cycle bioactivity

*Consider reviewing the curves more specifically for a single chemical weight-of-evidence.*

- Troglitazone
- Treatment for Type II diabetes, works primarily by activating PPAR $\gamma$ 
  - Also involved in immune response via decrease in NF-KB
- Drug removed from market due to DILI, with several proposed mechanisms, including:
  - Mitochondrial toxicity [Electron transport chain inhibitor (Complex I) at low micromolar concentrations]
  - Inhibits of bile acid transport/cholestatic effects (e.g., BSEP)
  - Apoptosis
  - Formation of reactive metabolites/oxidative stress

# Vignette two: Screening-level endocrine bioactivity assessment

Evaluate mystery compound B for endocrine bioactivity risk

# Examine physicochemical properties such as logP, vapor pressure, and MW to get a better sense of whether the chemical was suitable for the current *in vitro* assay suite

Analytical chemistry:  
was the chemical  
present and in the  
DOA for current  
ToxCast?

ToxCast negatives: what does a negative mean? Outside of domain of applicability (DOA)?

# Bioactivity summary in the Dashboard

Selective or non-selective?

Selective or non-selective?

- $AC50 < \text{burst?}$
- $AC50 \ 0.5\log_{10}$  distance from burst?
- $AC50 < \text{parallel viability assays?}$  This makes sense if you have parallel viability assays.
- How else to filter ToxCast data: 3+ caution flags and curves with both low efficacy and potency values below the concentration range screened, certain curve properties (such as the maximum), etc.
- Other related ideas:
  - What other assays appear active in a similar concentration range?
  - Is there consistent support for MOA(s), or is it nonspecific activity?

- Data change: curve-fitting, addition of new data
- Models change: improvements, more data, etc.
- The CompTox Chemicals Dashboard release from July 2020 is now using ToxCast invitrodb version 3.3:  
<https://doi.org/10.23645/epacomptox.6062479.v5>
- All ToxCast data and endocrine models (CERAPP, COMPARA, ER, AR, steroidogenesis) can currently be accessed from within invitrodb.
- Data downloads for NCCT: <https://www.epa.gov/chemical-research/exploring-toxcast-data-downloadable-data>
- We anticipate a new ToxCast release in 2021.

# An IVIVE approach based reverse toxicokinetics has been developed

High-throughput toxicokinetic (HTTK) approaches make it possible to predict doses corresponding to in vitro bioactivity for thousands of chemicals.

*Reverse dosimetry can be leveraged in IVIVE to estimate the exposure that would produce the plasma concentration corresponding to bioactivity*

# High throughput toxicokinetics (HTTK)

## *in vitro* data

Hepatic clearance from suspended hepatocytes

Plasma protein binding

## Generic toxicokinetic models

= *httk*

## Some high-level assumptions:

- (1) bioactive nominal *in vitro* assay concentration  $\sim$  *in vivo* plasma concentration that would correspond to a similar effect;
- (2) plasma concentration can be approximated by steady-state kinetics; and,
- (3) external exposures (in mg/kg/day units) that may have resulted in that plasma concentration can be constructed using estimates of species-specific physiology and Phase I and Phase II enzyme-driven hepatic clearance.

# IVIVE via high-throughput toxicokinetic data and models

Identification of a potency value to use for IVIVE of a threshold dose

- Operationally, the httk R package (v 2.0.4) can be downloaded from CRAN or GitHub for reproducible generation of administered equivalent doses (AEDs).
- $AC_{50}$  or  $LEC$  (micromolar) \* (1 mg/kg/day/ $C_{ss}$  (micromolar)) = AED prediction
- Httk package optionally implements multiple models that can have increasing complexity based on data available (e.g., using pbtk model or including interindividual toxicokinetic variability).

3.3 mg	g	mol	1e6 μmol	= 14.45523 μmol/L = μM	0.1 μM	1 mg/kg/day	= <b>0.007 mg/kg/day = AED95</b>
L	1000 mg	228.291 g	mol			14.45523 μM

# Bioactivity:exposure ratio requires exposure

Comparison to  
exposure predictions  
for a  
bioactivity:exposure  
ratio

- Total population predictions are based upon consensus exposure model predictions and the similarity of the compound to those chemicals monitored by NHANES. The method for the total U.S. population was described in a 2018 publication, ["Consensus Modeling of Median Chemical Intake for the U.S. Population Based on Predictions of Exposure Pathways"](#).
- When available, demographic-specific predictions are based upon a simpler, heuristic model described in the 2014 publication ["High Throughput Heuristics for Prioritizing Human Exposure to Environmental Chemicals"](#).

Bioactivity:exposure ratio = BER95 = **0.343**

- Mystery substance B is Bisphenol A, which clearly has some *in vitro* nuclear receptor activity at concentrations that may be below or near cytotoxicity.
  - It has moderate ToxCast ER agonist and AR antagonist scores.
  - The cytotoxicity threshold or “burst” seems to support selectivity of some nuclear receptor responses.
  - Diving a little deeper into the intended target family supports this analysis.

# Screening level assessment example: combine NAMs for exposure, *in vitro* bioactivity, and toxicokinetics

- Conducted by Accelerating the Pace of Chemical Risk Assessment (APCRA)
  - *“international cooperative collaboration of government agencies convened to address barriers and opportunities for the use of new approach methodologies (NAMs) in chemical risk assessment” (Paul Friedman et al., accepted)*

## Utility of In Vitro Bioactivity as a Lower Bound Estimate of In Vivo Adverse Effect Levels and in Risk-Based Prioritization

(APCRA partners for these two case studies)

# Case study workflow

# Prioritize chemicals based on BER for all bioactivity or for some target bioactivity

*For 448 substances, ~89% of the time, the point-of-departure based on ToxCast (POD-NAM) was less than the NOAEL/LOAEL values available from animals.*

Figure 3 from Paul Friedman et al.

<https://doi.org/10.1093/toxsci/kfz201>

# How to blend bioactivity-exposure ratios (BERs) and specific NAM-informed hazard indications?

Challenges	Opportunities
NAM-based hazard indications may be “semi-quantitative” or relative to the screened set	Use comparisons to known reference chemicals to inform uncertainties on the relative potency, efficacy, or phenotype for a given new chemical
NAM-based hazard indications may not cover all of biology	Use broader screening platforms to try to cover more breadth and use “Tier 2” and “Tier 3” platforms to further target specific hazards of interest
Many NAM-based hazards may appear to occur at similar concentration ranges	Qualitatively flagging possible hazards and also quantitatively identifying a “lead” hazard may be informative. Seeking “selectivity” may be useful.

**Thomas et al. 2019 further evolves a tiered screening strategy that adds in broader biological coverage but also suggests that we can strive to do more than BER in some cases.**

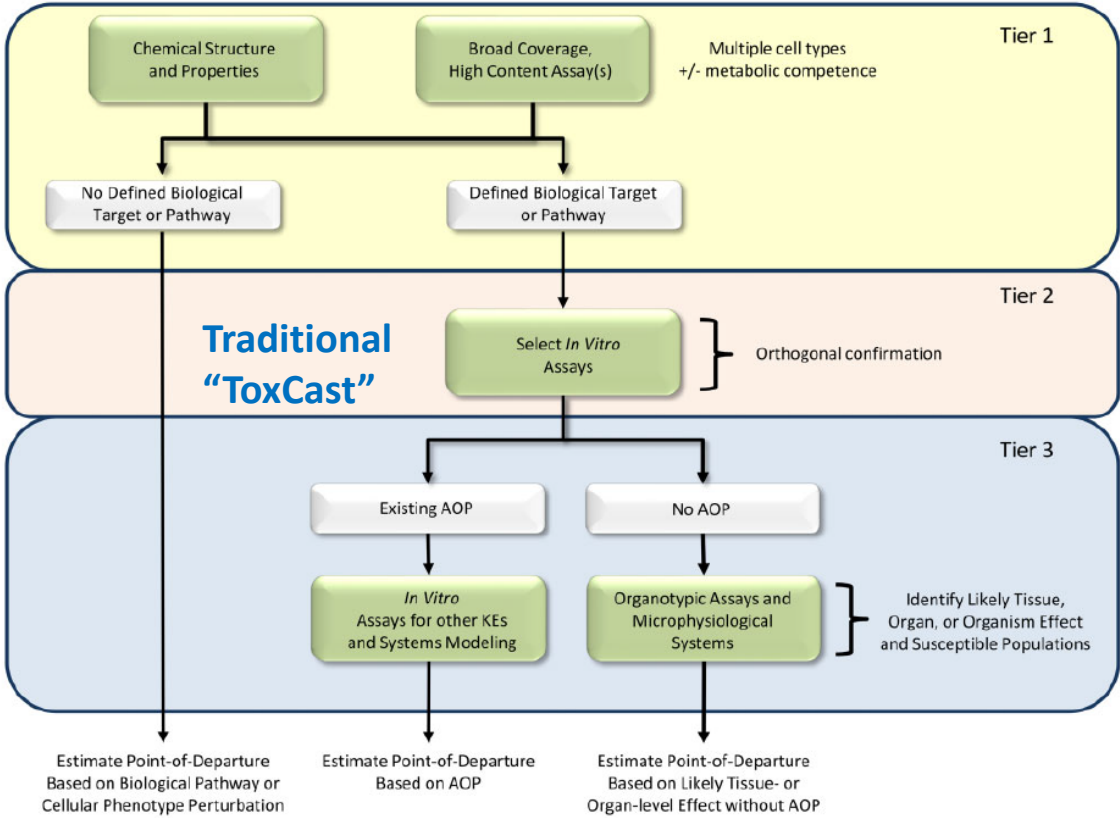

Figure 2. Tiered testing framework for hazard characterization. Tier 1 uses both chemical structure and broad coverage, high content assays across multiple cell types for comprehensively evaluating the potential effects of chemicals and grouping them based on similarity in potential hazards. For chemicals from Tier 1 without a defined biological target / pathway, a quantitative point-of-departure for hazard is estimated based on the absence of biological pathway or cellular phenotype perturbation. Chemicals from Tier 1 with a predicted biological target or pathway are evaluated Tier 2 using targeted follow-up assays. In Tier 3, the likely tissue, organ, or organism-level effects are considered based on either existing adverse outcome pathways (AOP) or more complex culture systems. Quantitative points-of-departure for hazard are estimated based on the AOP or responses in the complex culture system.

- Bioactivity data, including ToxCast, may help inform hazard prediction for weight-of-evidence, screening, and new approach methodologies-based points-of-departure for risk assessment.
- A high-throughput toxicokinetic approach to in vitro to in vivo extrapolation can translate bioactivity data in micromolar concentrations to administered equivalent doses for comparison to exposure or other *in vivo* data.
- The Comptox Chemicals Dashboard provides a data browsing and downloading capability to support weight-of-evidence evaluations and screening.
  - Consider that operationally, the steps taken to prepare a dataset for a single chemical weight-of-evidence evaluation may be different from preparation of a dataset for many chemicals.

# Acknowledgments

- Thank you for listening.
- Thank you: Tony Williams, John Wambaugh, and Richard Judson.
- Please reach out to us if you need support or explanations for a specific case, or if you find issues.

# What about one more example: TBBPA?

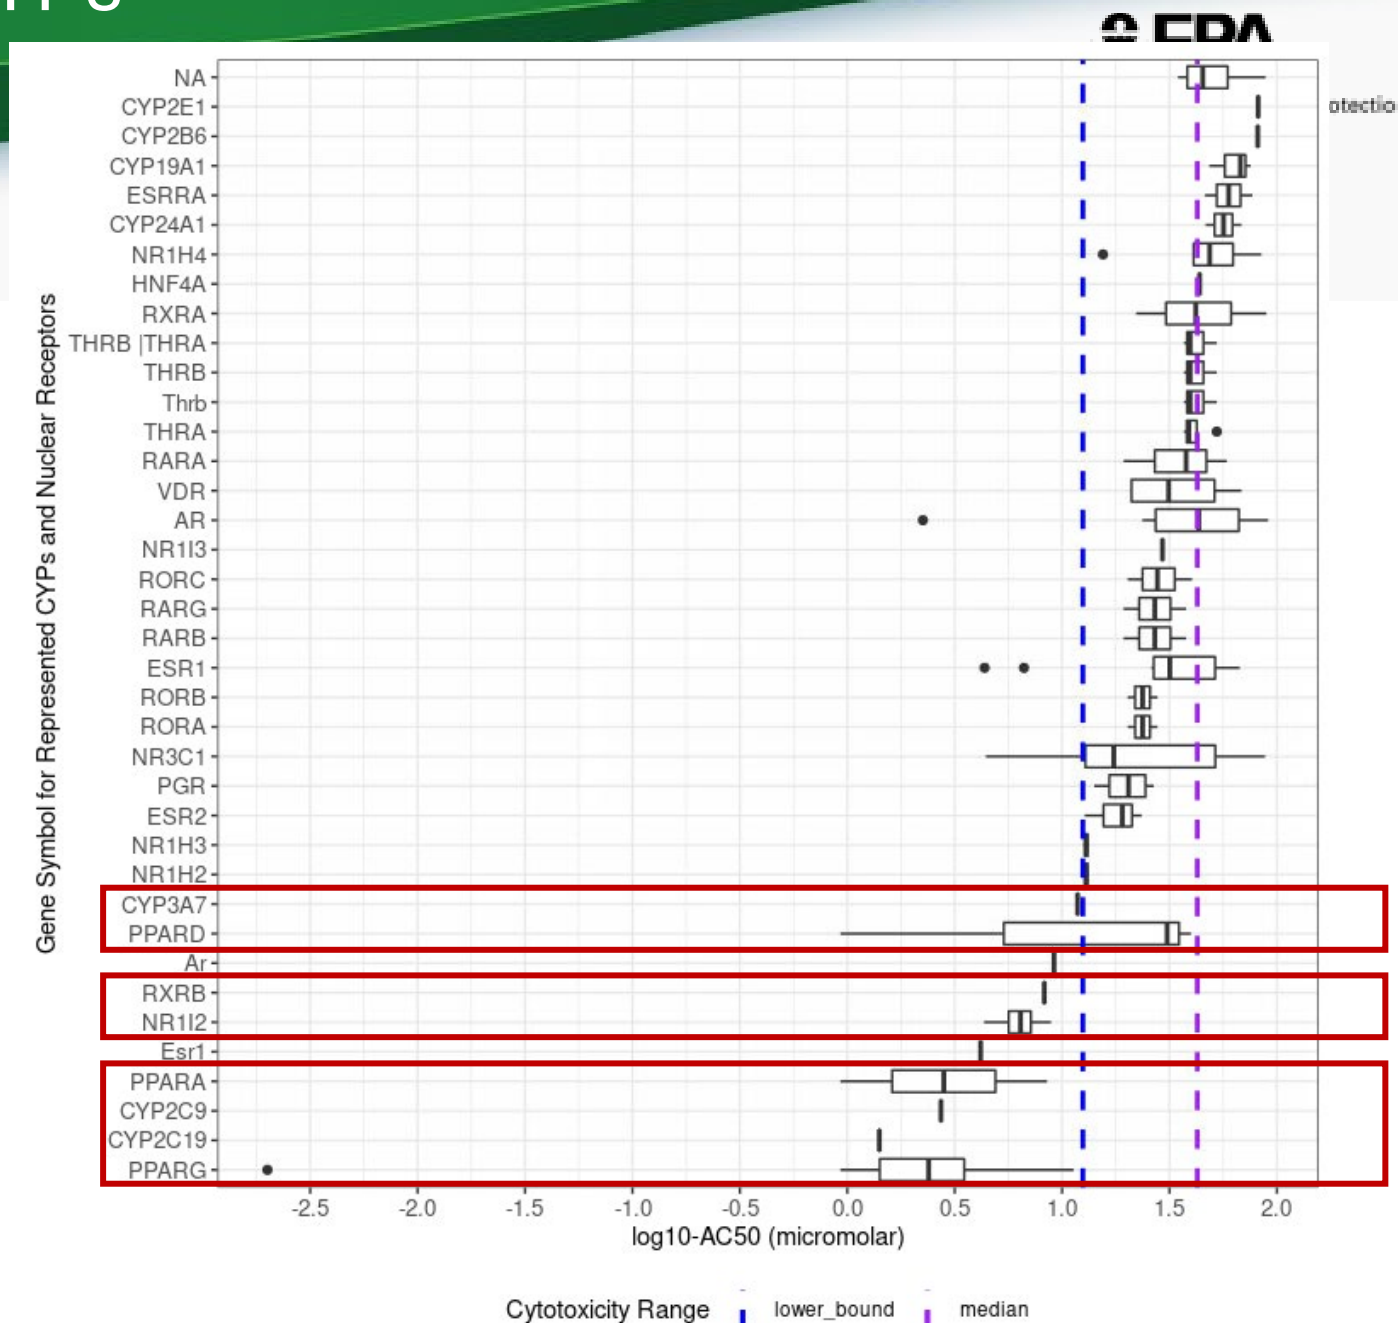

- TBBPA is a fairly promiscuous substance (hit rate > 30%), with clear cytotoxicity across platforms at ~40  $\mu\text{M}$  (lower bound estimate of ~12  $\mu\text{M}$ ).
- It's possible that some nuclear receptor activity precedes effects on other targets.

# TBBPA: nuclear receptors and CYPs

- Looking more specifically at nuclear receptors and related CYPs, there is good support for activity at multiple PPAR, CAR/PXR, at concentrations lower than other receptors and/or cytotoxicity.

- Looking at just PPAR, PXR, and CAR related endpoints, there is redundant support across assay technologies.

- TBBPA is not very active in the ToxCast ER and AR pathway models; a borderline hit for the AR antagonist model.

3,3',5,5'-Tetrabromobisphenol A

- However, TBBPA has a moderate effect on the HT-H295R Mahalanobis distance model due to moderate effect sizes on progestogen synthesis.

# TBBPA: with respect to thyroid-related targets

- It seems that TBBPA may participate in a “permissive heterodimer” effect for TR and possibly other RXR heterodimer partners.
- Several cell-free, non-receptor thyroid hormone synthesis-related targets (TPO, NIS, and DIO) are inhibited by TBBPA at concentrations (20-50  $\mu\text{M}$ ) that approach cytotoxicity and/or exceed PPAR-related effects (1-10  $\mu\text{M}$ ). The parallel cytotoxicity/non-specific protein inhibition assays were negative.
- Could be interesting to see TBBPA in a thyroid microtissue model of thyroid hormone synthesis to see if effects were observed.
